

Instructions to Enter Data

1. Go to a web browser and type this address into the address bar:
<http://192.168.1.116/index.html>
2. This will bring up a list of the B16 weather variables. Depending on the data that you would like to enter, click on the appropriate link.
3. Fill out the correct data on the top of the form, and start to enter in the data from the B16 Form.
4. After the first table has been filled out, fill out the second table by referencing back to the B16 to check your data.
5. If there are any errors, such as the two tables do not match, refer back to the B16 to check your data. Do not check with the other table.
6. If there are no errors, then continue onto the next weather variable ore the next day for the B16 data.

Special Cases:

1. For Relative Humidity and Lowest Visibility, if there is not a recorded instance at one of the times for the B16, then enter in “-1” without the quotes. For Sky Cover Eighths, if there is a time when it was not recorded, then select “Not Recorded” from the list.
2. If for precipitation the data on the B16 says “T”, enter .001 into the form.
