WORCESTER POLYTECHNIC INSTITUTE**

The Effect of Computer Technology on the Movies

by

Matthew Streeter

under the advisement of

Prof. Lee Fontanella

3/3/99

This project report is submitted in partial fulfillment of the degree requirements of Worcester Polytechnic Institute. The views and opinions expressed herein are those of the author and do not necessarily reflect the positions or opinions of Worcester Polytechnic Institute.

Matthew A. Streeter

Abstract

This project investigates, through qualitative and quantitative measures, the effect of computer technology on motion pictures. Following a comprehensive technical overview, a series of essays elucidates the role of film both as art and popular mythology, and analyzes thirty popular movies for content with respect to their use of digital tools. Finally, an exhaustive quantitative investigation presents statistical correlations generated by an original computer program from nearly ten-thousand pages of input data, with rigorous analyses of their implications.

A note on the presentation:

This project was originally presented as a series of hypertext (HTML) documents. In the conversion to printed text, some of the document's internal structure has unfortunately been lost. The contents page that follows represented a set of "hyperlinks" used to navigate the document, and other hyperlinks, such as those for the movies and statistics tables, are gone as well.

The ordering of pages in this document follows what is set out in the contents page. Following the prose section (about 50 pages), you will find the movie tables (about 100 pages), the statistics tables (about 20), and an appendix giving the code of the program used to generate the tables (approx. 30 pages). Additionally, the quality of the pictures is somewhat degraded in this printout, and page breaks often occur in unfortunate places.

Should you wish to view the project online, it should be available until May 2000 at: <http://www.wpi.edu/~mjs/iqp>.

Introduction

The purpose of this project is to study the effect of computers on motion pictures. Use of computers in feature films has been escalating over the past few years, sometimes for the better, and often for the worse. Through both qualitative and quantitative investigation, I will seek to determine to what extent computers are liberating the art of film, allowing filmmakers to express bigger, broader, more epic visions, and to what extent they may be poisoning it, promoting flashy, unimaginative special effects films to the exclusion of more thoughtful and sincere artistic endeavors.

My qualitative analysis consists of three sections. The first, "Movies as Art", investigates the way movies convey truth in the context of different realms of human experience. The second, "Movies as Myth", explores how movies may act as a modern substitute for the hero stories of old, tapping into shared experience across various aspects of our lives. Finally, the "Role of Computers" section looks into the ways in which computer technology has been used in a large number of feature films, and attempts to judge this usage as good or bad in the context of the previous two sections.

The quantitative analysis consists of a description of the procedures I used to gather a large amount of data concerning movies and the use of computers in the production of movies, and an in-depth statistical analysis of the relationships between the use of computers, the amount of money films earn at the box office, and the critical approval they receive.

I hope that, in reading these sections, the reader will come away with a more thorough understanding of how this emerging technology is affecting our art and lives.

Technical Overview

The medium of the film will, I think, very quickly become all digital.

- George Lucas¹

Introduction

Computers have been in use in the production of feature films ever since the 1977 release of *Star Wars*. Beginning with motion control technology, computers and computer software have invaded every aspect of the film process, from the word processor used by a screenwriter to the sophisticated image manipulation software used in post-production. The following sections provide an overview of the primary applications of digital technology to the changing art and craft of making movies.

Motion Control

Pioneered by John Dykstra in 1975 for the production of *Star Wars*², computerized motion control technology allows for the movement of the camera to be controlled via a programmable computer. Exact camera moves, aperture changes, adjustments to focal length, etc. can be programmed into the system, and a precise series of movements can be repeated as many times as desired. Motion control is often used when two or more elements of a scene need to be filmed separately, to be later optically composited as elements of a single scene. If the camera is to move during the filming, it is essential that the movements be exactly the same for both elements, in order for the final composite to look correct. This precision is only possible with the help of a computer.

As an example, suppose we want to have several TIE fighters zooming toward the Death Star, while the camera pans down and maybe tilts a little. Each TIE fighter has to be flown on wires and filmed separately, so that the wires that support each model can be optically removed, and also, perhaps, to simplify the puppeteering of the models. It is essential that the camera's panning and tilting be exactly the same for each model, otherwise one TIE fighter may appear to wobble or rotate with respect to the others.

Another common application for motion control is in movies like *The Parent Trap* or *Multiplicity*, where one actor is assigned to play multiple parts. Before the advent of computerized motion control, the camera had to be "locked down" whenever this kind of shot was used. Using motion control technology allows the camera to move freely, which makes for a much more visually impressive experience.

Wire & Rig Removal

When, for various dramatic reasons, a character is to be seen falling from a cliff, flying through the air, or floating above the ground, it is always important that the wires and supports that help to achieve these affects in the real world are not noticeable in the finished sequence. To understand the effect of computer technology on this particular aspect of movie-making, it is first necessary to understand the traditional optical techniques used to achieve such an illusion. Let us suppose, as a hypothetical example, that we wanted to show Paul McCartney flying over a grassy field, as was done in his music

video for *Off the Ground*⁸. The effect would be accomplished in three phases: blue screen, rotoscope, and matting.

Blue screen

Many people are familiar with the "blue screen" effect often used in TV weather forecasts, allowing the meteorologist to interact with an animated graphical map which, in actuality, is not there. Basically, the weatherman will stand in front of a large, blue sheet and point at various parts of it from memory. This image is then passed through an optical filter which replaces the blue sections of the image with the appropriate sections from the map. In our Paul McCartney example, Paul would be suspended from wires, filmed against a blue screen, and composited against the grassy field background plate. But there is one problem: the wires, unless they are sufficiently thin, will still be noticeable in the composite. To eliminate this problem, it is necessary to make use of another mainstay in optical technology: the *rotoscope*.

Rotoscoping

Rotoscoping is a process whereby regions of an image can be manually selected with great accuracy and then altered in some way. The rotoscope is a combination projector and camera which projects, one frame at a time, still images from a reel of film onto a large, blank piece of paper, held in a fixed position. An artist will then trace, on the paper, a region of the image that needs to be altered. Once a frame has been traced, the paper will be set aside, a new piece of paper fastened in place, and the rotoscope advanced by one frame. When all the frames have been outlined in this way, the outlines can be used for a variety of purposes, most notably as blueprints for *articulate mattes* (see next section). In our hypothetical example, the rotoscope artist would have to manually outline each of the wires that were used to support Paul's body. These outlines would then be inked in, placed back in their positions one at a time, and filmed by the rotoscope. The end product of all this is a new set of frames featuring the wires as black silhouettes against a white background, and nothing else. The usefulness of these wires will become apparent in the next section.

Matting

The process of matting is used to selectively combine sections from one or more images into a single final image. One or more source images are exposed onto a single master piece of film with certain areas left unexposed, or "blacked out", via what is called a matte. The basic idea is simple. Suppose you have a sheet of plastic, the left half of which is clear and the right half black. You place this sheet in front of the lens of a camera and record, say, some pedestrians on the streets of London. Later, you might flip the plastic over, making the left half black, and record a similar scene from a Paris street onto the same piece of film. The result would be a split screen -- half London, half Paris. The clear/black plastic has been used as a matte.

Using an optical printer, our black wire silhouettes can be printed onto clear plastic, producing a series of mattes. Additionally, the negatives of the wire silhouettes can be optically printed, producing mattes where the wire portion of the image is clear. The former are known as black-center, or male mattes, while the latter are known as female mattes. These two sets of mattes can be used, similarly to the way the London/Paris split screen was created, to composite the frames of Paul hung by wires in front of a blue screen with frames of a blank blue screen, producing, finally, frames of Paul seemingly suspended in midair in front of a blue screen. The resulting blue screen images can then be optically composited with the grassy field background plate, using the methods of the weatherman effect, to

produce the desired result.

The Digital Influence

There are a few limitations associated with the blue screen, rotoscope, and matting processes described in the previous sections. First, Paul cannot interact at all with the background plate. It would not be possible for example, for a farmer standing on the grass to toss Paul a beach ball, since Paul and the farmer would never actually be filmed in the same place at the same time. Secondly, he must always be in "front" of the background. He cannot, for example, fly temporarily behind a tree and pop out from behind it without extensive additional rotoscoping. Finally, the techniques themselves involve a considerable amount of effort for every frame to which they are applied.

In *Back to the Future, Part II*, there were several scenes involving the use of "hoverboards" -- futuristic skateboards that are able to fly a few feet off the ground -- in which these limitations were thought to be too restrictive. So, instead of being filmed against a blue screen, the characters were actually "flown" on wires through the set. The problem of removing the wires then fell into the digital realm. Using a digital image manipulation program, the wires were "blended" in with the surrounding pixels, rendering them invisible to the naked eye.

This same digital technology can be used to undo production mistakes that optical techniques would be unable to fix. For example, in Woody Allen's *Manhattan Murder Mystery*, it was discovered in post-production that in one of the scenes, a long black sound wire was visible, trailing down from under Allen's shirt. To remove this unsightly error and avoid costly re-shooting, Industrial Light and Magic was called upon to perform what producer Ned Gorman described as "a very complex digital blend"⁴ to erase the wire.

Digital Composites

Digital compositing is exactly what it sounds like: the composition of multiple source images into a final master via digital technology. The software involved is relatively simple, and operates in much the same way as the cut and paste functions of commercial paint programs. The advantage to doing things digitally is that, unlike with optical compositing, there is no generational loss: the master image is just as "clean" as the source; there is no opportunity for dust collection, scratches, chemical disfigurements, or fading. The first all-digital composite was for the "Donovan's Destruction" sequence of the 1989 blockbuster *Indiana Jones and the Last Crusade*⁵.

Digital Image Manipulation

The term *digital image manipulation* refers to the alteration, via computer software, of an image or set of images in a movie. Such alterations are used for a variety of purposes, among them the wire & rig removal techniques discussed in a previous section. Other uses include digital set extensions, the "cleansing" of set elements, and various shadowing and lighting effects.

Digital Set Extensions

Often, the expansive sets that a director envisions are too expensive or difficult to actually construct. Rather than settle for simpler, smaller sets, digital technology allows existing sets to be composited, either with paintings or with CG objects (see CG Elements), to form larger, more visually

impressive sets with little additional cost. An excellent example of the use of this technique can be found in *The Truman Show*, featured below⁶.

Digital "Cleansing"

Sometimes, when set elements are dirty or discolored, it is cheaper to clean up the filmed images of them than to clean the actual elements. Particularly when the elements are large or are not owned by the filmmakers, digital technology provides an economical alternative to scouting for newer elements or building scale models. The two frames from *Contact*, below⁷, show how the Arecibo radar dish, which, though fully functional, appears worn and ragged, was digitally cleansed to give it a much more sleek and modern look.

Before . . . and after.
The digital wand does its work.

Shadowing and Lighting Effects

Image manipulation programs such as Adobe Photoshop allow for easy alteration of subtle lighting and shadow effects. It is possible to simulate additional light sources within a frame, to selectively darken or brighten any area of an image, and much more. Often, when images shot under different lighting conditions must be composited into a final master image, some digital massaging helps the finished product look more believable.

Morphing

Webster's dictionary defines *morphing* as "a special-effects process used in film or video production in which persons or objects seem to change shape, form, etc. in a smoothly continuous series of images . . ." We have all doubtless seen the Exxon commercial where a tiger morphs into a sports car, or that razor one where the man's face changes into a cube.

Morphing technology was first developed for George Lucas' 1988 film *Willow*, in which a tiger morphs into a sleeping woman⁸. The basic idea is to select a series of common points between the two images (say, the

Computer-generated "water tentacle" from
James Cameron's *The Abyss*

tip of the tiger's nose and the tip of the lady's), enter them into a morphing program, and allow the morphing program to perform a complex algorithm to generate the intermediary frames.

Especially memorable uses of morphing in the movies include those of two films from director James Cameron: *The Abyss* and *Terminator 2*. The screen shot above, from *The Abyss*, illustrates the ability of morphing technology to create exciting, original, and heretofore impossible characters.

CG Elements

Modern computer software allows objects such as planes, ships, and cars to be modeled as a polygon mesh, textured with individual pictures, and rendered into a photorealistic final image. What I have chosen to call CG (computer-generated) elements are computer-generated objects that maintain a fixed shape and do not move with respect to themselves. Thus, a flying airplane is a CG element, while a bounding Tyrannosaurus Rex is a CG creature. CG elements are, of course, the simpler of the two from a technological standpoint.

An excellent example of a subtle, artistic use of CG elements was in Steven Spielberg's *Empire of the Sun*, where CG fighter planes were added to a shot of the Shanghai sky².

CG Creatures

The "full motion" dinosaurs in *Jurassic Park* are one of the first and most memorable instances of computer-generated creatures. Unlike models, CG creatures exist only in computer memory, and are formed, like CG elements, from a polygon mesh. The added complexity of CG creatures is that, when they move, they must be animated in a life-like way. The Tyrannosaur must heave and lumber like the giant animal that it is, its weight must shift as it moves, and its skin must appear to stretch as its muscles expand and contract. All of this requires a great deal of programming and simulation. Pioneered, like many digital effects technologies, by Industrial Light and Magic, the technology used to generate CG creatures has since been applied to such films as *The Relic*, *Mighty Joe Young*, *An American Werewolf in Paris*, and *Godzilla*.

Movies as Art

The test of literature is, I suppose, whether we ourselves live more intensely for the reading of it.

- Elizabeth Drew

The same could be said, perhaps, of any art, though it seems to me particularly true of film. Movies have an unusual ability to move us, to awake within the human spirit a sense of drive and purpose that is seldom evoked by other art. When we sit within a darkened theater, sharing a life-like experience with hundreds of strangers, feeling pain, joy, fear, anger, and the whole spectrum of emotions, we become uniquely vulnerable to the insights of artists into our lives, our families, our society, and our world. It is in these four realms: one's self, family, society, and the world or universe that movies develop their themes, play out their conflicts, and provide their resolutions. Though it is an unusual approach, it seems to me particularly instructive to look at these areas one at a time, and examine how they are dealt with and beautified in the art of film.

Movies as self-realization

Much of the power of film lies in its ability to present characters with which we can readily identify. Often by portraying them as especially innocent, witty, sexy, powerful, vulnerable, or otherwise extremely endowed, movies give us screen personas that we respond to as a manifestation or exaggeration of qualities in our own personality. As these characters clash and battle one another or themselves, we root for the ones whose qualities, perhaps, we would like to see further developed in our own lives.

There are a handful of ordeals or struggles which nearly everyone encounters in the course of a lifetime. Beginning from childhood, we must learn to act in a civilized and responsible manner, to apply our intellect toward the resolution of problems or the overcoming of obstacles we might face, to think of others as well as ourselves, and to develop our own unique personalities and beliefs independent of those imposed on us by our parents and our society. Then, passing through puberty, we must once again learn to repress certain raw instincts in favor of more refined behavior, acting in a respectful and learned manner, cultivating charm, and acquiring skills and ideas that will help us achieve our economic and social goals going into middle age. Eventually, we must learn to give up this mortal body and accept the limitations of our powers and actions as we pass into our final years. All of these things can be thought of as thresholds which, if passed successfully, lead to a healthy, productive life, and if not, to misery and neurosis. By showing us, in the context of a situation that is larger than our own lives, how other people, though fictional, have crossed or failed to cross these thresholds, and the consequences that have ensued, movies contribute to our development as psychologically healthy human beings. There are a handful of movies I have picked out in this section which seem to me exceptionally moving and important in this area.

E.T.

E.T., the story of a young boy who finds solace from his parents' divorce in a supernatural friendship, deals with the importance of hanging on to innocence in the face of a cynical, callous, and insensitive world. Eliot, the protagonist, has little joy in his life as the movie opens. He hangs around with his older brother's friends, who, a few years older than he is, seem to have passed some critical point where their behavior turned from sweet and modest, like Eliot's, to largely competitive, threatening, extroverted, and obnoxious, though they are not without their charm. It is this, combined with the lack of a strong father figure in his life, that makes Eliot's predicament especially pitiable.

When E.T. shows up in the back yard, everything changes. Eliot, as a circumstance of his innocence, is the first one to find and befriend him, and in doing so quickly becomes the center of attention in his family. The very presence of E.T. in his life is enough to turn around Eliot's social situation. But in addition to this, E.T.'s magical powers, which include telepathy and healing, represent a spiritual escape from the world Eliot has come to know.

From this initial setup, the story develops beautifully as a conflict between Eliot's world of wonder, innocence, faith, compassion, and love and the grown-up world of power, order, science, and dissection. Eliot and his siblings must make use of all their wits to keep the alien safe, and in doing so they come to a profound new understanding of the latent potentials in each other and themselves. The film has been widely analyzed as a retelling of the Christ story, and insofar as the coming of Christ represents in the Christian ideology a revival of those same qualities I earlier attributed to Eliot, I think this interpretation is quite accurate.

The turning point comes when it is discovered that E.T. is allergic to the Earth's atmosphere and is dying. He can not live in this world; they must get him home in order for him to survive. When E.T. improvises a radar dish out of spare parts in the family garage, the boys take him out into the woods to see if he can "phone home". This leads to the darkest sequence in the film, as E.T. becomes very sick, begins to lose the coloration in his skin, has trouble breathing, and falls ultimately into the hands of government scientists who are interested, should he fail to survive, in using him as a potential research subject. These scenes are played out with great drama and sadness, to the point where E.T.'s heartbeat flatlines and, from a purely medical standpoint, it appears that he is certainly dead.

It is at this point that Eliot, alone with E.T.'s corpse, expresses the void he feels in his life and the lack of feeling that will certainly, unchecked, lead him into much the same kind of adulthood that has been portrayed so far in the film. This is the critical point in his life, where he either loses faith in the goodness of the world around him or holds onto it, and, with the help of E.T.'s spirituality and the magical words "I love you", he is able attain the latter path. The film's finale is one of the most memorable in all of cinema, establishing firmly in the mind of anyone who watches it that, despite how dark things may seem, or how dead the world to us, there is the potential, as if by magic, for great and inspiring things to enter into our lives and re-invigorate that all too oft forgotten childlike existence.

Close Encounters

Another Steven Spielberg film, *Close Encounters of the Third Kind* deals with many of the same issues as *E.T.*, though in a more lighthearted and comedic style. Richard Dreyfus plays Roy Neary, a line worker whose accidental encounter with a U.F.O. possesses him with a strange and singular vision to impart meaning to a certain inanimate, lumplike shape. The shape, it is gradually revealed, is that of Devil's Tower in Wyoming, where the aliens are finally to land.

Though Roy Neary is certainly less vulnerable than Eliot, he is no less susceptible to wonder in the face of an alien encounter. From the moment of his first contact with them, he becomes talkative and excitable, and, as he enlists the help of his increasingly skeptical and distraught family in his search for answers, he borders on a crackup. The essential question for him is not whether or not he will be able to find the aliens, or how they will be treated by human beings, but whether what he has experienced is real. Thus, in what Charles Derry has identified as an element common to many of Spielberg's films, "[A]n everyman protagonist has his conception of the world enlarged . . . as he comes face to face with some extraordinary and generally non-human antagonist . . ."¹, though the word antagonist may be misleading in this context.

The personal issue at stake in all this is whether an adult, accustomed to the humdrum world of his job and the challenging, but ordinary world of his family can come to terms with a supernatural experience without being afraid and without losing his own sanity. Overcoming fear, and searching to validate one's beliefs are the central themes of this film.

Pulp Fiction

Quentin Tarantino's intriguingly winding narrative explores, as the screenplay's title page suggests, "three stories . . . about one story."² The three stories are, presumably, those of a bank-robbing couple that go straight, a boxer who gets in over his head after failing to throw a fight, and, as the main plotline, a couple of savvy hit men who, after a traumatic near-death experience, decide to go their separate ways.

In the beginning, we meet Jules and Vincent, two charming young fellows who ride in "[a]n old gas guzzling, dirty, white 1974 Chevy Nova"³ and discuss minor cultural differences between Europe and America, and are, as critic Roger Ebert notes, ". . . as innocent in their way as Huck and Jim, floating down the Mississippi and speculating on how foreigners can possibly understand each other."⁴ After a brief digression on the ethics of foot massage, they knock on the door of an apartment to begin their real mission: the recovery of a briefcase, the mysterious contents of which are never revealed in the film.

They walk in on a trio of college kids, eating breakfast. "Whatcha having?" Jules asks them. "Hamburgers" comes the nervous reply. "Hamburgers! The cornerstone of any nutritious breakfast," Jules taunts. While the audience cannot help feel sympathy for these poor young men obviously in way over their heads, it is equally difficult to feel any particular antagonism toward Jules or Vincent, since they are the heroes, and are in their own way quite naive and charming. It is this kind of tension, fear, dark humor, and moral ambiguity that keeps anyone watching *Pulp Fiction* on the edge of their seat. This, in combination with the movie's clever combination of profanity and violence with uncanny dialogue and wit give the film a kind of special, forbidden feel, which is no doubt the source of much of its popularity.

The film builds on this setup, taking us through a number of hairy situations, as for example, when Vincent takes the big man's wife (his boss, Marsellus Wallace) out for the evening and accidentally allows her to overdose on heroin, or the subplot involving Butch, who, after almost getting revenge on

Marsellus Wallace, is captured and nearly sodomized by a couple of hillbillies. In every case, the central characters, whether they are the perpetrators of violence or its victims, have an essential winningness and humanity about them which, despite their outrageous lifestyles, makes them easy to identify with. The feeling is one of basically good people trapped in really bad places, which taps into a human tendency to regard oneself as a good person stuck in a corrupt world, and adds considerably to the power of the story.

The movie is sufficiently funny and entertaining that it would not have needed to make any kind of moral statement in order to be successful. It is in part this fact that makes the film's resolution so genuine. Returning, after some 100 minutes, to the early scene in the college kids' apartment, the film portrays in its last act events that occur chronologically after that interrogation, but chronologically before most of the action we have already watched. As Jules and Vincent recover from their shooting of Brett, the leader of the collegiates, a fourth college kid comes out from the bathroom and blasts Jules and Vincent with a .357 Magnum. Miraculously, the bullets don't hit anyone, which provides the set up for the incredible resolution of this story.

Jules thinks that what happens to them was "an act of God". Vincent is skeptical, but Jules stands firm. He figures, if God has gone to the trouble of giving him a break this good, he'd better find a nobler calling than the one he's been satisfied with so far. This conviction leads, ultimately, to Jules leaving behind the life he has known and setting out to "walk the Earth", until "God puts me where he wants me." This, combined with the fact that we have already seen the skeptical Vincent get killed earlier in the movie (remember, it ends in the middle), provides a powerful message of morality and redemption without, due in large part to the extremity of the violence and the comedy with which it is presented, a trace of sanctimoniousness or superficiality.

In all of these stories, you will notice a common theme, which is of an "ordinary" life transfigured by a magical, or seemingly magical turn of events, into an vital and extraordinary one. This is a metaphor for real human experience. It is not the stuff of fairy tales, nor is it merely "escapism", as some have labeled Spielberg's work in particular⁵, but a real and important message based, no doubt, on powerful experiences in the filmmakers' own lives. There are other stories following this same pattern, such as *Contact*, *Empire of the Sun*, *The Abyss*, and *Free Willy* and its sequels, and, though they vary in form and style, their conclusions are largely the same. Thus, whether you respond more readily to the sweet spectacle of Spielberg or the bone-crunching realism of Tarantino, you may get from one of these movies, or one like it, a renewed sense of wholeness, purpose, and desire to participate in the sorrows, joys, failures, and triumphs of your life.

Family Values

The various conflicts that are common among members of a family, as well as the different loves that exist as a part of the Freudian "family romance", have always served as a rich bed of inspiration for narrative artists. The potential trap of clinging to one's mother, the struggle to meet the expectations of the father while still developing one's own unique character, and the struggles of sibling rivalry are among the motifs of many literary and cinematic artworks, and in watching or reading these we are presented with a unique opportunity, as children, to learn profound life lessons from art. Though many films deal primarily with family problems, and most touch upon family issues in one way or another, there is a particular set of films which have garnered such an unusual amount of critical attention and popular appeal that I feel it is an adequate illustration of my ideas on this subject to focus on three films exclusively, namely, Francis Ford Coppola's and Mario Puzo's *Godfather* trilogy.

The Godfather Trilogy

Marlon Brando as
Vito Corleone

The first of the *Godfather* movies opens with a medium close-up of a man's face. Pleading, appealing, he makes his case to *someone* offscreen. He is vulnerable, weak, pitiful, . . . a child. As the camera ever so slowly pans to the left, the back of Marlon Brando's head comes gradually into frame. He is calm, impassive, not cold, but not easily moved. He is in control of the situation, knowing, wise. This is the classic father figure.

Marlon Brando's portrayal of Don Corleone in this movie has provided us with unforgettable images of a dark, powerful, yet honorable and dependable father figure, who, despite his involvement in crime, is admirable, and a role model from which many lessons can be learned. The entire plot of *The Godfather* and its two sequels revolves around father-son relationships, in the first installment between Don Corleone and his sons, Michael, Sonny, Fredo, and the adopted Tom Hagen, and in subsequent chapters between Michael Corleone and his children and nephews. The stories deal with ideas of duty, respect, and, as mentioned earlier, the struggle of sons to develop independently of authority figures.

Michael Corleone, returning heroically from service in World War II, does not want to become his father. He is to be married to a beautiful young wife (Kay Adams, played by Diane Keaton), he has earned the respect of society through his courage, he has a bright future outside of crime, he has gone to college, and furthermore, his father respects and understands this. There is no reason for him to see himself in any other role. An events unfold, however, he will undergo a gradual transformation, the end result of which is to create a mass murderer, who, unlike his father, is hateful of life and hated by his wife, feared by his family, and does not deserve our admiration, but rather our pity.

The first step in this tragic journey is an attack on Don Corleone, by a rival crime family, which results in the Don's near death and subsequent hospitalization. The Corleone family has been weakened, and, somewhat like Hamlet, Michael must now step into a role for which he is not ready, and the weight of which will inevitably crush him. This is not, of course, apparent at the outset. Lying in his hospital bed, supported by an I.V., Don Corleone is weak and in need of protection from rival crime families who will kill him otherwise. Michael is forced by circumstance to provide some of this protection, standing watch outside the hospital and pretending, with another nervous visitor, to be armed. As he coaches and eases the fears of his partner, it looks as if he has matured and actually gained some strength from his father's injury. When later confronted, however, by an overzealous police officer (McCluskey), Michael is punched in the jaw, which leaves him bitter and dark. This single injury, which to his brothers seems minor and even humorous, comes at a point in Michael's life where his entire view of the world is shifted by this one blow, from an accommodating place where, though rivals exist, the system is predominantly just and stable, to a corrupt and unfair structure of authority, which, if he is to maintain his duty to his family, he must oppose with power and violence. This feeling leads ultimately to Michael's murder of McCluskey, after which point his fate is sealed.

Through the remainder of the film, Michael will participate in and initiate a series of increasingly violent events. Anyone who crosses him, or who acts without the best interest of him and his family in mind, is a candidate for swift elimination. This is not the way his father operated, but it becomes, especially in the second installment of the trilogy, the way he operates. Even Don Corleone himself expresses regret at the choice of lifestyle his son adopts, telling him

I never wanted this for you. I work my whole life, I don't apologize, to take care of my family. And I refused - to be a fool - dancing on the string, held by all those - bigshots. I don't

*apologize - that's my life - but I thought that - that when it was your time - that - that you would be the one to hold the strings. Senator - Corleone. Governor - Corleone, or something...*⁶

And why not? Why did Michael fail to fulfill his father's expectations? The answer, I believe, can only be that, because of the pressure and responsibility he had thrust upon him, Michael developed within his mind a rigid and unquestionable code of conduct, based, no doubt, on a somewhat warped and immature view of his father's behavior, which he was too scared to violate, and yet which he did not possess the maturity and wisdom to responsibly uphold. As becomes increasingly apparent in the next chapter (which ends with Michael's killing of his own brother), Michael is operating under a set of rules and expectations that is not quite real, and is not truly his own. In struggling to perform his duty, he is destroying everything he holds dear.

It is in the final chapter of this story, *The Godfather, Part III*, that the full tragedy of the life Michael has chosen unfolds. Having failed to meet his own father's expectations, Michael becomes a repressive father figure himself, attempting to mold his son into a future Don, though the young man wants little to do with it. The one redeeming force in this film seems to be Michael's teenage daughter, Mary, of whom he is very fond. The alternative, represented by his hot-blooded nephew Vincent, presses all too forcefully on Michael's soul. He wants to bring his family out of crime, into the light, but cannot do so. Again, his sense of duty restrains him. And so, in the film's poetic last scenes, he loses the one thing he most held dear -- his daughter -- and the *Godfather* Trilogy comes to a close.

Though it deals primarily with one specific aspect of the family drama, the *Godfather* trilogy presents powerful life lessons concerning the ideas of duty, responsibility, and respect. Like other films that deal with family issues, the *Godfather* movies force us to recognize in their characters certain potentials and latent conflicts within our own families, and so are able to bring feelings out into the open which may otherwise have remained in the closet. This openness is part of the unique power of art, and represents a special demonstration of the instructive ability of film.

Movies as Social Criticism

Though there is a tendency, popularized by philosophers like Rousseau and Marx, to hold one's society accountable for all the shortcomings of one's life, it must nevertheless be acknowledged that criticism of the laws, customs, and culture of society can be an important tool for mass recognition of important problems, and a valuable impetus to meaningful change. Though it lacks the acid tongue of literature, film as an art has given us several splendid works of profound social criticism, including two that I find to be particularly insightful: John Frankenheimer's *The Manchurian Candidate*, and Dennis Hopper's *Easy Rider*.

The Manchurian Candidate

The story of a returning Korean War "hero"'s struggle with brainwashing and thought control, *The Manchurian Candidate*, released in 1962, represents a remarkably timely and insightful look into the evils of McCarthyism. The main character, Raymond Shaw, is the son of a controlling mother (played by Angela Lansbury) and a bumbling McCarthy-like father, senator Johnny Iselin. When fighting in Korea, he and his platoon are captured by Chinese and Russian Communists, and brainwashed to act as assassins when they return to their home country. Though this seems like a setup for a scared, narrow-minded, propagandist, anti-Communist film, it develops through a series of remarkable twists into one of the most objective pictures of the forces involved in the red scare that has ever been captured on film.

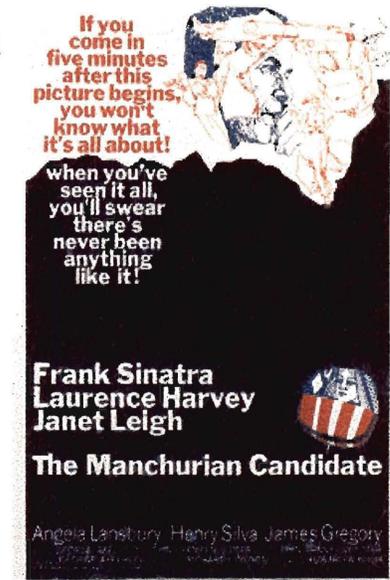

There are clues early in the film that there may be more to its ideology than meets the eye. In the first brainwashing scene, a Chinese senior military officer informs the numerous officers in attendance at his demonstration that the subjects, the members of Shaw's platoon, have been put into a trance and led to believe they are attending a meeting of a women's gardening club. The scene alternates between the soldiers' perception of events and the events themselves, suddenly replacing stern military figures with old women fanning themselves, and clinical descriptions of hypnosis with nasal digressions on various properties of obscure plants and vegetables. Watching this with thirty years' perspective, it is quite funny, and one gets the feeling that, even to an audience still faced with a very real Communist threat, this movie must have seemed not to take itself *quite* seriously enough to be a propaganda film.

As the plot develops, we are introduced to Ray's parents: his power-hungry mother and subservient father, whose efforts to get elected President rest largely on his ability to accuse other members of Congress and the Department of Defense of being "card-carrying members of the Communist party". After making one such bold speech in front of the television cameras, he is questioned by reporters as he leaves the building. "How many Communists did you say?" "174", he quickly replies. Another reporter asks, "how many?" "Uh, 211," he answers, then, to another, "89". In a later conversation with his wife, Senator Iselin will complain "Can't we just decide on one number, babe? The guys are starting to rag me about it", when comes Mrs. Iselin's coolly calculated response: ". . . are they asking *if* there are any Communists in the Department of Defense? No! They're asking *how many!*"

The development of Iselin's election campaign is juxtaposed with the increasingly effective attempts of the Communists to turn Raymond into an assassin. Now that he is back in America, they must make sure that the psychological "linkages" still function correctly. Then, and only then, can he be turned over to his "American operator", who will program him to perform the final job, the nature of which we are not told. The enduring moment of this film comes when the American operator is revealed to be none other than Mrs. Iselin herself. The McCarthyists are in fact in league with the Communists, in an attempt to assassinate Iselin's rival, a decent, honest man with more traditional American values. McCarthyism, the reaction of a hysterical American public to a misunderstood threat from abroad, is thus shown to be of the same evil that its purpose was, presumably, to extinguish. The presentation of this idea is tremendous in the film, and it stands out in my mind as one of the most introspective and lucid social dramas I have ever seen. It is as if the piece had been directed by someone looking back at these events with 200 years' hindsight. Incredible.

Easy Rider

Though it lacks some of the symbolic and narrative precision of the previous film, *Easy Rider* is no

less a powerful social statement. Starting off with no sound, the opening segues into "Born to be Wild" as Peter Fonda and Dennis Hopper cruise down the road. The two of them represent the best of the liberated sixties generation, with their easy manners, relaxed codes of ethics, and simple sense of respect for each and every member of society as a unique individual. This set of ideals is built up in opposition, not so much to the establishment as a whole, as to its more conservative and violent elements, represented by rednecks. When Wyatt (Peter Fonda), Billy (Dennis Hopper), and George (Jack Nicholson) walk into a cafe, they are taunted by rednecks, mainly because they have long hair. As George is later to explain, the hippies represent a kind of freedom with which the rednecks are uncomfortable.

Though the film takes us through a number of fairly free environments, including the open road, a hippie commune, a carnival, and Mardi Gras, we are always left with the feeling that this freedom is transitory, that something will intervene to keep it from staying real. That intervention comes once and for all in the film's startling conclusion, as Wyatt and Billy, riding on their motorcycles, are shot one by one by a couple of rednecks in a

pickup.

Though the narrative may seem simplistic, it has to do with important issues of individual freedom. Though the hippie movement was often seen as self-indulgent, there were at least some aspects of it that were true and noble, and it is these that *Easy Rider* brings out. The film seems to say that these aspects of the movement were being drowned out and repressed by ignorance and fear, and so represents to me a powerful social statement made during a very turbulent time.

The Ultimate Mystery

The final realm of concern for artistic motion pictures is what I like to call "the ultimate mystery". Every now and then a film comes along with the confidence to tackle the truly big questions. What happens to us when we die? Is there a God? What is the ultimate destiny of mankind? Such films might properly be called *metaphysical*, though that is really only one aspect of a much broader whole. Two films in particular stand out in my mind as being especially profound and philosophical: Stanley Kubrick's monumental *2001: A Space Odyssey*, and Ingmar Bergman's classic *The Seventh Seal*.

Though I do not know enough about the Bergman film to give it a serious critical analysis, it is clear to me from a single viewing that the film poses deep questions about death and God. Critic Roger Ebert has identified the central issue of the film, as in many of Bergman's works, as "the absence of God".⁷ Indeed, though Death is presented in the film as a supernatural figure, there is no such representation of anything else. This is the work of a director trying to come to terms, via his young knight hero, with a seemingly soulless world, which, like that of medieval Europe in the time of the black plague, often seems far more dead than alive. The unforgettable recurring image of the knight playing chess against Death himself is a microcosm of the film as a whole, where the hero makes moves -- actions, thoughts, decisions -- but to no purpose, and with little chance of victory.

2001: A Space Odyssey

The Dawn of Man

Stanley Kubrick's 1968 masterpiece represents perhaps the most startling combination in the history of cinema of stark, unerring technical realism, mind-blowing visual effects, and serious, deep philosophical narrative. Opening with "The Dawn of Man", the film takes us on a metaphysical journey through space and time, the end point of which is to be symbolic of nothing less than the ultimate destiny of mankind.

The film's first act consists of the interactions of a group of almost human apes with an unforgiving natural environment. Far from any romantic notions of a pre-societal utopia, the apes' world is depicted as barren, stagnant, and inescapable. When a mysterious black rectangle, later identified as a monolith, appears on the ground, its smooth, highly ordered shape is the first sign of a capability that will forever change life on Earth: intelligence. This, the film tells us, is the dividing line between human and animal. For, apparently inspired by the monolith, a lone ape, identified in the novelization as Moonwatcher, discovers the potential ability of a dried-up bone as a club, and thus, with the creation of the first weapon, brings about the dawn of mankind. In what has been called "the longest flash-forward in the history of cinema"⁸, the hurled bone dissolves into an image of another weapon: an orbiting nuclear device created as part of the ongoing cold war between the United States and Soviet Union. Though four million years have passed, little, it seems, has changed.

It is in the second act of the movie that Kubrick develops his darker themes of humanity vs. technology. For, whereas in the first act, with the innocent apes as helpless victims of their environment, the scene is set for something startling and wonderful to happen, the subject of the story is now the animal of all too little innocence, man, and the problem: man's power to use his intelligence to transform the natural world into weapons of great danger and destruction, potentially bringing about his own downfall. Even the construction of human-like, seemingly perfect computers provides no escape, as the ill-destined technological savior, HAL 9000, quickly proves. With its long, silent shots of mechanical space action by seemingly unfeeling human beings, *2001* creates an atmosphere ultimately not unlike that of its first act. It is an atmosphere from which the viewer hopes to be released, though this time, the atmosphere is that, not of some long-forgotten precondition to our own evolution, but of the viewer's own society.

It is with this setup that the film leads us into its ultimate and incredible final act. Traveling through a mind-bending series of planes, curves, trapezoids, and other arrangements, the main character, Dave Bowman, ends up in what looks to be a hotel suite. He there undergoes a series of transformations: from a thirtyish man in a space suit, to a middle-aged man in a robe, to an old man lying on a bed. It is then that the breakthrough comes. For, standing ominously at the foot of the bed is none other than the mysterious black monolith, the portal, as it were, to a greater stage in evolution. As the old man extends his finger feebly to the monolith, he is transformed into a strange, bluish, glowing fetus. Then, as the camera tracks into the monolith, we find ourselves in space. As "Also Sprach Zarathustra" makes the blood run cold in our veins, the camera pans from the moon, gradually down over the Earth, and finally to the left, revealing the same fetus, now blown up to planetary proportions.

What does it mean? Certainly the fetus, or Star Child, as it is termed in the novelization, possesses qualities of innocence and wonder, combined with some kind of cosmic wisdom which one can only begin to comprehend. Is it the next stage in the evolution of man? Is it a psychological state that individual humans can achieve? An abstraction of some profound social or cultural development yet to come? Or, perhaps, a combination of all these things?

The Star Child

All Four Realms

Though the films that have been analyzed so far certainly do not lie strictly within the "realms" I have assigned them, each film has certain dominant themes or motifs which make for easy classification of this nature. There are some films, however, which are bold enough to take on most or all of these realms at once. They are what I have chosen to call "mythic" films, in that they attempt to provide a kind of all-encompassing vision of one's self, family, society, universe, and the various interactions that take place between them.

Movies as Myth

[Movies] might be our counterpart to mythical re-enactments . . . what is unfortunate for us is that a lot of the people who write these stories do not have the sense of their responsibility. These stories are making and breaking lives. But the movies are made simply to make money. The kind of responsibility that goes into a priesthood with a ritual is not there. That is one of the problems of today.

- Joseph Campbell, *The Power of Myth*¹

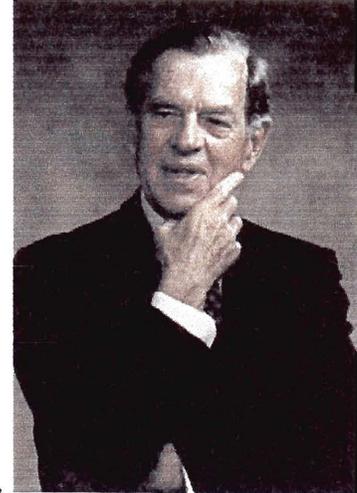

There is an interpretation of movies which seems to me virtually untouched by academic film criticism, which is the idea of regarding them not simply as an intellectual exposition of one set of ideas or another, be it an experiment with existentialist motifs, a thoughtful overview of Marxist ideology, or an interesting variation on the ideas of Freud or Jung, nor merely in their social/historical context as, say, a bold step for the feminist movement, a satire on political correctness, or a moral sermon against the evils of the Vietnam War, but as a kind of deep religious experience, whereby actual lives can be directed and transformed.

Perhaps part of the reason for this absence is that the rapture one feels on occasion in the theater, watching certain movies, and without which the art would be deprived of a great deal of its "magic", is difficult to justify or convey. Who can put into words the experience of first seeing Luke Skywalker disable his targeting computer in the climactic Death Star battle, the joy when Eliot's bike lifts off in *E.T.*, the nobility of Humphrey Bogart's decision at the end of *Casablanca*, the awe inspired by "Also sprach Zarathustra" in *2001*, or the sense of human progress when Jules and Vincent leave the restaurant at the end of *Pulp Fiction*? Though it is the ostensible purpose of film criticism to objectify some of these emotions, it is essential that in doing so the issues involved are not reduced to mere semantics, i.e. that what I have chosen to call the *mythic dimension* of movies is recognized and preserved.

It has been said that writing about music is somewhat akin to dancing about architecture². A similar argument could, of course, be made for writing about film. In an attempt to avoid a reduction of the magnificence of cinema to the banalities of prose, I have chosen to present my ideas, again, in terms of actual examples of the movies that most clearly illustrate them. Though there is an inherent loss of generality in this approach, I feel that if I am able to convey a mere hint of the excitement, wonder, and sense of purpose I have felt in watching these films, it will justify my attention to this mythic dimension as an indispensable part of the cinematic experience. I begin and end, then, with what is probably the best example in the history of motion pictures of truly "mythic" filmmaking: George Lucas' *Star Wars* Trilogy.

The Star Wars Trilogy

Joseph Campbell once said that "Star Wars is not a simple morality play. It has to do with the powers of life as they are either fulfilled or broken and suppressed through the action of man."³ Drawing on such diverse influences as Arthurian legend and Japanese martial arts, the *Star Wars* trilogy, with its

Joseph Campbell,

brave young hero (Luke Skywalker), wise mentor (Obi-Wan Kenobi), beautiful (but self-willed) princess Leia, rugged individualistic Han Solo, strict imperial figurehead (Grand Moff Tarkin), dark, machinated father figure (Darth Vader), greedy monsters (Jabba et al), animal presence (Chewbacca), and id-ego comic duo (R2D2 and C3P0), presents indeed a vivid tapestry of the various powers and potentials that inhabit human life.

Opening with the now famous fairy tale preamble ("*A long time ago, in a galaxy far, far away . . .*"), the first chapter in this saga (or, rather, the fourth, if you read the opening title card), presents the initiation of the naive young Luke Skywalker into a world of conflict and adventure. Starting out a humble farm boy, Luke will be initiated into the venerable Jedi knighthood, a sacred order combining the best qualities of a medieval knight, Japanese samurai, Indian yogi, and Chinese sage. The Jedis, we discover, were once great in number, but, with the dissolution of the Old Republic and the swift rise of The Empire, they have been hunted down to all but extinction. This element of the backstory is important, as it is evocative not only of Hitler's rise in Germany, but of Caesar in Rome and conditions in American culture surrounding the Vietnam War. Perhaps most importantly, the Jedi is a spiritual warrior, so that his fading from the world is connotive of the loss of spirituality that the West has undergone in the past several hundred years. All of these evocations affect the viewer on a subconscious level. Through set decorations, props, clothing, manners of speaking, and other subtleties, Lucas is able to imply a rich background of meaning in what might otherwise be a simple story. Darth Vader, for example, with his mechanical suit and breathing mask, creates the impression of a man whose humanity has been subserviated to "the machine", i.e. the system, or the Empire which he serves. It is this conflict, between the spiritual, vital, self-actuated Jedi and the broken, tormented, repressive Empire, that is to form the basis of the stories in all three films, aptly representing the potentials for fulfillment or repression that Joseph Campbell identified as the movies' central theme.

In a chance meeting with Obi-Wan Kenobi, Luke first refuses the "call to adventure", as this meeting represents in mythological terms. While he hates the Empire and identifies strongly with the Rebellion that struggles to fight it, he is preoccupied with his home responsibilities and career, and does not want to get involved. Besides, what can he do? In answer to this, Ben awards Luke with a gift: his father's *lightsaber*, a brilliant glowing sword, the weapon of choice for a Jedi. It is important to note that Luke's father has died when he was very young, which absence is part of the lack of direction or sense of purpose in Luke's life. With this gift, strong feelings are re-awakened in him. He wants to learn more, so Obi-Wan tells him of the *Force*, "an energy field that surrounds all living things . . . it binds the galaxy together". Though Luke is intrigued, it will take a traumatic event to catalyze his resolve: when Luke returns home that day, he finds that his foster parents have been murdered by the Empire.

Thus begins the grand adventure. Luke, with the help of his new mercenary friend Han Solo, and, of course, accompanied by Obi-Wan Kenobi, sets out to travel to the planet of Alderaan, where an important message is to be delivered that will aid the rebels in their destruction of the Empire's ultimate weapon: the Death Star, a space station the size of a small moon with the power to destroy an entire planet. But the Death Star, we find, as already begun its work, and Alderaan is destroyed. As our three heroes near the planet, they find only debris. The Death Star, however, is still nearby, and, in an inevitable twist of fate, the heroes' ship is sucked inside the weapon, and the heroes nearly captured.

This segment of the adventure is known in mythological terms as "the belly of the whale", a term derived from the biblical story of Jonah and the whale, and represents a kind of second womb, from which the hero is either reborn a powerful new man, or like Darth Vader, crushed and subserviated. The heroes separate at this point, Obi-Wan going off to find and engage Darth Vader, while Luke and Han summon all their wits to attempt the rescue of Princess Leia. Though the duo is successful, Obi-Wan must ultimately sacrifice himself at the hand of Darth Vader, and the three of them, Luke, Han, and Leia, are forced to go on alone.

At rebel headquarters, the Death Star plans (which Obi-Wan sought to deliver to Alderaan) are

analyzed, and a strategy for attack is formed. This leads to the film's climactic finale, where the rebels, in small manned fighter craft, battle the behemoth Death Star. Luke is by now a selfless character, and quickly volunteers for the fight. Han Solo, however, is still the mercenary, and flies off to parts unknown to spend his reward (for saving Princess Leia).

The attack upon the Death Star is a difficult military maneuver. Flying through a narrow trench, the pilots must target a small, two-meter opening from a great distance, and hit their marks exactly to initiate a chain reaction which will cause the battle station to blow itself up. The first attempt is unsuccessful. In a series of aerial dogfights, other rebel pilots are eliminated so that, as if by the hand of fate, Luke is called upon to enact the final trench run. This is the critical moment, where the battle is either won or lost. It is the story's ultimate test of the hero's character. As Luke nears the point of fire, locking onto a thermal exhaust port with his targeting computer, several crucial story elements come together at once.

First, Darth Vader has joined the action as a pilot and is in close pursuit of Luke's fighter. Second, Han Solo, inspired perhaps by Luke's courage and Leia's beauty, has had a change of heart, third, Obi-Wan, though dead, has retained his spiritual presence as a ghost, and finally, the Death Star, maneuvering around the planet Yavin, is moving within firing range of the rebel's home base. As Luke nears the target, his computer counts down the distance remaining before he can fire. At the same time, Darth Vader is gaining, and the Death Star is getting closer to *its* firing position, creating an exciting three-way timelock. As Darth Vader is about to incinerate young Luke, Han Solo bursts out of hyperspace, fires on Vader's ship, and deflects him out of the way, just as Luke's computer locks on. A string crescendo prepares us for the moment of victory, then stops. "Use the Force, Luke," comes Obi-Wan's ethereal voice. "Let go." Switching off his targeting computer, Luke aims with his instincts (or his spirit?), destroys the Death Star, and saves the day.

Luke Skywalker makes the critical decision to "use the force" in his attack on the Death Star.

Luke's decision to use the force rather than his computer is critical to the message of the film. For, put upon by the pressures of the moment, Luke must still be loyal to his feelings and instincts, lest, like Vader, he become a slave to technology and to society. Yet instinct or feeling are really too narrow terms. For the force represents a kind of all-embracing spirituality, a basically Eastern idea given in the *Star Wars* films a humanistic, Western inflection, whereby men can be loyal both to the dictates of reason and to the depths of their innermost being.

The next chapter in this saga, *The Empire Strikes Back*, develops again the themes of humanity vs. the machine. Though there is no Death Star, the Empire is still alive and well, and, after the death of Grand Moff Tarkin in the Death Star explosion, Darth Vader has risen to even greater power.

We meet our heroes, Luke, Han, and Leia, on the forbidding ice planet of Hoth, the site of the second rebel home base. Voyaging out into the snow, Luke is attacked by a monster, knocked unconscious, and dragged to the beasts' cave to be eaten. This is a classic element in mythology. Constituting the primary motif in early, primitive myths, the struggle against monsters represents the struggle of humanity against primal, irrational forces that would seek to destroy our world. In such refined stories as *Star Wars* however, it is only a passing obstacle. Luke quickly incapacitates his foe, leading him, after successful initiation, onto greater adventure. The ghostly personage of Obi-Wan Kenobi instructs Luke that he must travel to the Dagobah system, where he is to meet the sagely Yoda, the Jedi master who instructed Obi-Wan.

The character of Yoda deserves special attention at this point. His wide eyes, short stature, and aged posture give him the look of an Oriental guru, and his Zen-like aphorisms reinforce this idea. Yoda

is a spiritual leader, a wise old character who has long since passed beyond the realm of action, and now concerns himself chiefly with the instruction of the young. Though Luke's potential is at first questioned, Yoda is ultimately to find him an apt pupil.

Steeped in the wisdom of the force, Luke is faced with his first trial at Dagobah: a journey into a cave. The cave, we soon learn, is a symbolic representation of Luke's own mind. "What's in there?" Luke asks. Yoda answers, "Only what you take with you." In entering the cave, Luke is to encounter his worst fear: an apparition of Darth Vader, with whom he engages in a brief lightsaber duel. Luke cuts off the head of his enemy, but when the Vader's mask is removed, the face behind it is Luke's. The message is clear: the potential for Darth Vader is within Luke himself; it is an enemy he must fight not only externally, in the world, but within the depths of his own psyche.

I am your father.
Darth Vader's revelation is perhaps the most shocking moment in the trilogy.

This revelation sets up one of the most shocking moments in the trilogy. When, through various turns of events, Luke becomes engaged in a climactic lightsaber duel with Darth Vader, the battle becomes spiritual as well as physical. Darth Vader tempts Luke to "give in to his anger", telling him that it is "his destiny", and that "Your future lies with me, Skywalker. Obi-Wan knew this to be true." As the battle progresses, the two warriors make their way onto a catwalk, which spans the depths of a seemingly

bottomless reactor shaft. It is then that Vader gains the upper hand, forcing Luke to the ground and again, tempting him to submit. When Luke refuses, Vader cuts off his hand. In great pain and trauma, Luke continues to resist. "Luke," Vader baits him, "you do not yet realize your importance. You have only begun to discover your power. Join me, and I will complete your training. With our combined strength, we can end this destructive conflict and bring order to the galaxy." "Never!", Luke retorts. A Jedi does not respond to such obvious appeals to his ego. Vader then plays his final card. "Luke," he ominously begins, "Obi-Wan never told you what happened to your father." "He told me enough. He told me you killed him." "No," Vader responds, "*I am your father.*"

Thus ends *The Empire Strikes Back*. Luke, reduced to a childlike state of fear and weakness, commits near suicide jumping into the reactor shaft, and it is only through the vigilance of his friends that he is able to come out alive. The new burden that has been placed upon him, that of Vader's fatherhood, will become the driving force in the mighty psychological conflict that is to unfold in the trilogy's dramatic final chapter.

In *Return of the Jedi*, the father-son conflict between Luke and Darth Vader reaches its utmost intensity. After a brief preliminary adventure involving the demise of Jabba the Hutt, Luke returns to Dagobah to discover, through Yoda, whether what Vader told him is true. Yoda admits that it is, and warns Luke of the powers of the dark side of the force, the powers of the Emperor. Yoda, old and feeble, is on his death bed, and refuses to train Luke. "But I've come back to complete the training," Luke protests. "No more training do you require," comes the master's response. Again, the message is clear. Through his dramatic conflicts with Vader at the end of *The Empire Strikes Back*, Luke has learned on his own what Yoda would otherwise have taught him. Now, as Yoda passes away, Luke and his fellow heroes must take their destiny into their own hands, in what is to be their final mission: an attack on a new and even more imposing Death Star.

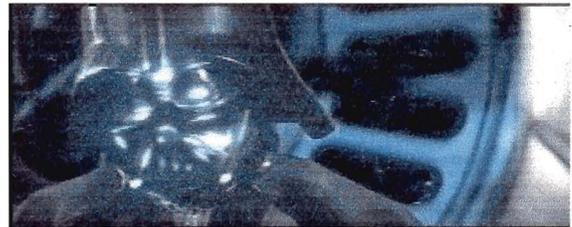

The new Death Star, we learn, is protected by an energy field generated on a nearby moon called Endor. While Han and Leia travel to Endor to disable the shield, Luke turns himself over to the Empire in an attempt to confront his father and "turn him back . . . to the good side". Luke is taken prisoner and brought to the Death Star, where he is to face the ultimate evil: the Emperor, a withered, sorcerer-like old man who controls the fate of the galaxy. Again, Luke is in the belly of the whale, only this time, he

is not there alone. For Darth Vader, impressed by Luke's maturity and touched by his son's compassion for him, begins to himself experience feelings of regret.

The psychological battle now plays both ways. While Vader attempts to convince Luke that his journey to the dark side is inevitable, and plays upon his sympathies to his friends (whom, it is revealed, have by traveling to Endor walked into the Emperor's trap), Luke tells Vader there is still good in him, a difficult statement for even Vader to refute. The two of them duel, with lightsabers and words, until finally Vader is forced to the ground.

It is at this point that an interesting triangle emerges. Like the resolution of *Star Wars*, that of *Return of the Jedi* involves the interplay of three characters, each representing a kind of life potential or force. The Emperor is pure evil. Darth Vader was once a charming young boy, who, overwhelmed by the pressures of his world, succumbed to the lure of power and the fear of disobedience, and is now a slave to the Emperor. Finally, there is Luke, who has been tempted by the same fruits as Vader but has refused to give in. With Vader on the ground and Luke towering behind him, the Emperor comes up from behind, and encourages Luke to finish him off. "Good, good!" he cackles, "your hatred has made you powerful. Now, take your father's life, and his place at my side!" The invitation, as suggested by the writings of Freud, is for Luke to use his Oedipal aggression toward his father to seize his father's power. But Luke is a spiritual and compassionate person, well versed in the wisdom of the Jedi, and refuses. This leads to perhaps the trilogy's most powerful scene.

As the Emperor, enraged, casts lighting bolts into Luke's body, Darth Vader climbs wearily to his feet and assumes a supportive position behind his master. Luke screams for mercy, not of course, to the Emperor, who is incapable of it, but to his latent human father. "Father! Help me! Father, please!" Darth Vader regards this, as everything, through his dark mask, and it is only through camera movement, as Vader's face grows and fills the screen, that we are able to sense the turmoil within his mind. Then, when it seems Luke is about to be destroyed, Vader undergoes his transformation. Summoning his former strength, he lifts the Emperor into the air, carries him to the edge of the catwalk, and hurls him to his death.

Darth Vader's redemption

The *Star Wars* trilogy thus operates on all four realms of human experience. Like the *Godfather* trilogy, it deals with the roles played by fathers and the conflicts that arise when their sons refuse to fill them. Unlike Michael Corleone, however, Luke is able not only to resist the temptation to become like his father, but to resist with such determination and nobility that the father, too, can be redeemed. With the spirituality of the force, the social setting of the Empire, and the themes of self-fulfillment and growth, the *Star Wars* trilogy stands as the best example I know of powerful, mythic film.

¹ *The Power of Myth*, p.102

² The quote "Writing about music is like dancing about architecture" appears on various Internet humor lists, though the source is unknown. See, for example, <http://talon.colorado.edu/~bennetta/humor/new/lists.html>.

The Role of Computers

Introduction

When I began this project, I had a list of some thirty movies, all of which had used computers in their production, which I felt would provide a thorough sampling of the various possibilities, good or bad, for the use of computers in making movies. I had the *Star Wars* trilogy in there, of course, as well as breakthrough effects films like *The Abyss*, *Terminator 2*, *Jurassic Park*, *Forrest Gump*, and *Titanic*, but I also had a number of movies that I knew had used computers in subtle and unobtrusive ways: the subtle coloring effects of *Schindler's List*, the set extensions of *The Truman Show*, the brief video manipulation sequence in *Rising Sun*, and the motion control used in the submarine segments of *The Hunt for Red October*, to name a few. I had to add *Toy Story*, the first entirely CG film, and a handful of special-effects extravaganzas for good measure: *The Mask*, *Independence Day*, *Godzilla*, *Small Soldiers*, *Jumanji*, *Dark City*, *Mission: Impossible*, *The Lost World: Jurassic Park*, and *Armageddon* were all on the list. Finally, there were a number of movies which I felt had used computers in particularly innovative or unusual ways, such as the character animation in *Babe*, the fantastic "oil painting" imagery in *What Dreams May Come*, the "war-enhancement" of *Braveheart* and *Saving Private Ryan*, the space launch sequence of *Apollo 13*, the "machine", "ride", and powers of ten sequences in *Contact*, as well as the humorous changes of focus in Woody Allen's *Deconstructing Harry*. Armed with a huge set of examples of definite positive uses of computers, and a mercifully small sampling of what were sure to be truly awful films (*Armageddon*, *Independence Day*), I was ready to begin my investigation.

The Good, the Bad, and the Ugly

In watching these movies, I found, as expected, some applications of computers that added visual brilliance to an already compelling story and premise, and others in which the presence of computerized effects seemed to be the sole justification, in the minds of the producers, for the film's existence. Following the approach of my previous analyses, I will go through the films one at a time, commenting upon the artistic use (or lack thereof) of computers in their production.

For ease of navigation, all movies reviewed are indexed here. Simply click on the appropriate title to jump to that review.

[The Abyss](#) - [Apollo 13](#) - [Armageddon](#) - [Babe](#) - [Braveheart](#) - [Contact](#) - [Dark City](#) - [Deconstructing Harry](#) - [Forrest Gump](#) - [Godzilla](#) - [The Hunt for Red October](#) - [Independence Day](#) - [Jumanji](#) - [Jurassic Park](#) - [The Lost World: Jurassic Park](#) - [The Mask](#) - [Mission: Impossible](#) - [Rising Sun](#) - [Saving Private Ryan](#) - [Schindler's List](#) - [Small Soldiers](#) - [Star Wars: Special Edition](#) - [Starship Troopers](#) - [Terminator 2](#) - [Titanic](#) - [Toy Story](#) - [The Truman Show](#) - [What Dreams May Come](#)

Also be sure to read the [conclusions](#) at the bottom of the page.

The Abyss

The water tentacle featured in James Cameron's 1989 breakthrough film was one of the first instances of a digital morph (see the [morphing](#) section of the technical overview). The character was mysterious and very compelling, and provided a sense of wonder, without which the film would have been just an underwater adventure story. Digital effects are what made this film memorable, and it stands as one of the most creative and original applications of that technology.

Return to [Movie Index](#).

Apollo 13

The rocket lift-off sequence of this film, made possible by digital modeling of the shuttle and launch pad, is breathtaking. I recall reading in a review of the film that veteran astronauts, having watched the film, asked director Ron Howard where he got such great archival footage. This kind of subtlety, where the effects serve as the background to, rather than the focus of, a story is a great example of conscientious, artistic use of digital technology in film.

Return to [Movie Index](#).

Armageddon

Watching this movie, which critic Roger Ebert referred to as "a feature-length" set piece¹, I felt that cinema had reached a new low. No scene in this film lasts more than thirty seconds, and the plot, what little there is, is presented at preview pace. Special effects seem to be the sole justification for this movie, and, though they demonstrate technical proficiency, they are not in any way engaging, original, or artistic. It is hard for me to believe that this was the biggest blockbuster of the summer.

Return to [Movie Index](#).

Babe

I regret to inform the reader that, due to an oversight, I actually forgot to see this movie. I am familiar, however, with the effects in question, namely the animation of animal faces to create the appearance that they are talking. This is, as I understand it, an essential feature of both *Babe*, and its sequel, *Babe: Pig in the City*, and in light of the high marks given to both films by critics Roger Ebert and Gene Siskel, I consider this an excellent application of computer technology to film.

Return to [Movie Index](#).

Braveheart

Like *Saving Private Ryan* (see below), *Braveheart* used computer technology to create the illusion of realistic war violence. Dozens of sword and dagger penetrations were added to the battle scenes

during post-production. The violence of these scenes helped establish the bravery and heroism of the film's protagonist, William Wallace.

Return to [Movie Index](#).

Contact

The use of computer effects in this film was truly amazing. The movie opens with a shot of the Earth, from space, with loud rock music blaring from the speakers. As the camera quickly pulls back through "virtual space", revealing the moon, Mars, Jupiter, and the glorious rings of Saturn, we hear radio clips from increasingly distant times: the moon landing, the Kennedy assassination, going back through history as we pull back through space (those familiar with radio waves will understand the reasoning behind this), finally, as the entire solar system begins to recede into a tiny point in the center of the screen, fading to silence. The camera continues to pull back, revealing many solar systems, flashing as tiny points of light, then, traveling through a disorienting field of gases, we find ourselves looking out upon the entire galaxy. The zoom-out continues, moving again through gases, until we are looking upon a sea of galaxies. Finally, as the camera draws further back, the entire universe becomes a bright blur, which, as we move back further still, is revealed to be the highlight of the main character's eye.

Stills from the opening of *Contact*.²

Other equally impressive sequences in this movie include a *2001*-like "ride" at the end, and a number of daunting shots of a mysterious whirling alien machine. Watching this film, I shuddered to think what Stanley Kubrick could have done with the stargate sequence of *2001* had digital technology been available to him.

Return to [Movie Index](#).

Dark City

This highly original noirish thriller featured stunning shots of a city whose geography is shaped by the minds of the people who run it. Through digital technology, the filmmakers were able to grow and shrink buildings in front of our eyes with a surprising degree of realism and believability. Roger Ebert listed this as his favorite film of 1998³, and, while I certainly do not think it deserves quite that much attention, it is very creative in its story, characters, mood, and especially its visual effects.

Return to [Movie Index](#).

Deconstructing Harry

There are only a few special-effects shots in this movie, though they are so funny that they deserve special attention. The joke involves a character who is "out of focus", literally. The part of the screen that his body occupies looks as if it was shot with a different camera. The scenes are played straight, with the character (played by Robin Williams) seriously discussing his condition with a doctor ("I've never seen that before.") Though a similar effect could be achieved with optical technology using a rotoscope, it would not have been as convincing and would certainly have been more difficult.

Return to [Movie Index](#).

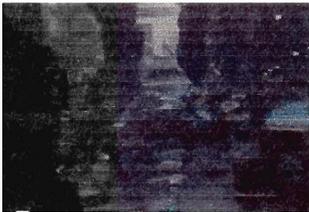

Forrest Gump

A breakthrough visual-effects film, *Forrest Gump* features numerous sequences of doctored archival footage that make it seem as if the main character, played by Tom Hanks, is interacting with historical figures such as John F. Kennedy, Lyndon Johnson, and John Lennon. Based on a novel, this film used cutting edge technology to bring to the screen a story that would otherwise be unfilmable.

Additionally, there are some subtle shots involving the use of computers in which a character who has lost his legs, in reality played by the able-bodied Gary Sinese, interacts with his environment in such a convincing manner that reportedly, the actor's agent had trouble getting him walking roles after *Forrest Gump's* release. The use of computers allowed for greater flexibility in the casting of this character, who, without that technology, would have to have been played by a disabled person.

Return to [Movie Index](#).

Godzilla

Yet another film in which the presence of a CG creature seems to negate, in the filmmakers' minds, the need for any further creative thought. Apart from lacking any technical or social realism, the movie actually forgets the constraints of physical reality as it places its huge antagonist, a 300 foot Godzilla, within fifty-foot confined spaces. Since only the monster's eyes or face are visible, the viewer is presumably not supposed to wonder where the rest of the body went. Indeed, the monster seems to miraculously shrink or grow throughout the movie, depending on the needs of its half-cooked plot.

Return to [Movie Index](#).

The Hunt for Red October

Motion control technology was used to create the tense submarine footage for this exciting underwater film. The submarine shots were essential to the narrative, and could not have been realized with the same degree of realism were it not for digital technology.

Return to [Movie Index](#).

Independence Day

Again, an excess of visual effects and lack of adequate plot and character development, combined with a lack of social realism, make this movie a chore to sit through for anyone above the emotional age of 12. The film presents a view of alien contact, which, next to those presented in such visionary films as *Close Encounters* and *Contact*, seems frightened and immature.

Return to [Movie Index](#).

Jumanji

The use of digital technology in this film consisted of a number of highly believable CG creatures which interact convincingly with a small town and suburban home. Though I did not find the film personally appealing, there was nothing outrageously wrong with it and the special effects were worked cleverly into the story.

Return to [Movie Index](#).

Jurassic Park

A breakthrough visual-effects film, *Jurassic Park* presented us with unforgettable images: a brontosaurus eating from a tree, apatosaurs moving gracefully through a lake, and, of course, a giant Tyrannosaurus rex chasing a jeep, eating a lawyer, and hunting smaller herd animals. Many critics complained about the movie's plot and character development, and not without reason. Though these were certainly above average, they lacked the originality and sense of wonder of earlier Spielberg pictures.

Return to [Movie Index](#).

The Lost World: Jurassic Park

Jurassic Park's sequel lacked the originality of the original film, and, though it contained some exciting moments, it was on the whole a disappointment. Ever since he has started making serious films like *Schindler's List*, Steven Spielberg's children's films have lacked a certain vision and authenticity.

Return to [Movie Index](#).

The Mask

Though I did not personally like this film, I must admit that, if the kind of humor presented appeals to you, this movie contains some of the best of it. Jim Carrey finds a mysterious mask that turns him into a superhero. In a number of stunning visual effects shots, Carrey is morphed into a cartoon-like dog, made to shoot bullets from his mouth, flattened, and much more.

Return to [Movie Index](#).

Mission: Impossible

An overall mediocre film, *Mission: Impossible* featured some eye-popping effects, such as when an old man peels off his face to reveal underneath the face of Tom Cruise. Again, story and characters seem to be short-changed in this movie.

Return to [Movie Index](#).

Rising Sun

The use of computers in this film involved a sequence demonstrating how video images could be manipulated by swapping the heads of actors Shaun Connery and Wesley Snipes. Visually entertaining and humorous, this sequence fit smoothly into the film's overall plot, and, rather than showcasing or glamorizing the technology involved, seemed to provide a warning against the dangers of image-manipulation technology when it falls into the wrong hands.

Return to [Movie Index](#).

Saving Private Ryan

The digital effects for this film fall into the category of "war enhancement", i.e. bullet hits, explosions, amputated limbs, and other effects that would be too dangerous or expensive to achieve using traditional stunt techniques. The film is, in my opinion, the best war movie ever made, and, though its brilliance lies primarily in the writing and in Steven Spielberg and Janusz Kaminski's brilliant camerawork, it would not have had the same gut-level emotional impact without the shocking realism of the combat scenes, made possible by computers.

Return to [Movie Index](#).

Schindler's List

The little red girl, which some people dislike but I thought was touching, was achieved through the use of computers. Additionally, there were some very subtle lighting effects, such as adding yellow hues to some of the candles in the film, which were also done with computers. Though both of these effects are possible with optical technology, they are easier to achieve with digital tools. I believe the availability of digital tools encouraged Steven Spielberg to consider such subtleties as these, and added some minor touches of depth and character to an already amazing film.

Return to [Movie Index](#).

Small Soldiers

Small Soldiers featured computer-generated toy soldiers that come to life. Though the premise seems to have potential, the movie does not do much with it. The writing is rather weak, and the character and plot development are careless. It is as if the producers felt the mere presence of computer-generated imagery would carry the film, which it certainly does not.

Return to [Movie Index](#).

Star Wars Special Edition

After the myth section, you know I'm going to love this one. George Lucas has raved about the powers of digital technology, referring to the process as "very liberating"⁴. Indeed, Lucas was able to achieve a more accurate rendering of his original vision by incorporating modern digital effects into these films. Specifically, a number of sets were extended, allowing for sweeping views of Mos Eisley and Cloud City, as well as a number of "virtual cities" at the end of *Return of the Jedi*. Perhaps the most stunning effect in the special edition films was the addition of a new scene featuring a computer-generated Jabba the Hutt interacting with a vintage 1977 Han Solo! The scene had originally been shot, evidently, with a human Jabba stand-in but was never completed. Using advanced technical wizardry, Industrial Light and Magic was able to add a lifelike alien character to existing twenty-year-old footage.

Return to [Movie Index](#).

Starship Troopers

Watching this movie shortly after having seen *Armageddon*, I was amazed to see my conception of bad film completely redefined. This movie is incredibly awful, the worst I have ever seen. The ideology behind it, more than just being braindead, is actually Fascist, even pro-Nazi. The cinematography is equal to that of a bad 1950s serial. Even the special effects, which, as part of the movie's 60-million-dollar budget, must have been quite expensive to produce, are shot against unconvincing background plates of unoriginal locations.

Return to [Movie Index](#).

Terminator 2

The liquid metal T-1000 featured in this film is, along with the water tentacle from *The Abyss*, one of the most compelling characters created using digital morphing. The T-1000's ability to change shape, to become other people, to recover from bullet hits, and to transform its limbs into stabbing weapons helped to create a tremendously original, threatening, and visually exciting villain for this James Cameron film.

Return to [Movie Index](#).

Titanic

Though my personal interest in this film is quite limited (I thought the dialogue was flat and the characters one-dimensional), it has garnered considerable critical approval and popular appeal, and I must admit the special effects are quite good. Numerous overhead shots of the boat as it sank into the water would not have been possible without the use of computers. Additionally, though a 9/10 scale model of the ship was used for many key scenes, there were often computer-generated extras on the ship's deck or elsewhere in the scene. Many of the effects that one would expect to be generated by computers in this film are actually models, and many of the scenes that seem straightforward actually involve subtle digital manipulations of reality. The two blend smoothly, and, though the effects of the film were obviously a major draw at the box office, they work well with the story and are skillfully and

tastefully executed.

Return to [Movie Index](#).

Toy Story

The first entirely computer-generated film, 1995's *Toy Story* was a success. Though the human characters in the movie look blocky and unrealistic, the toy characters, who consume most of the screen time, are very convincing. The movie reportedly took several terrabytes to store on disk, and represents a bold step in the world of digital film. One thing that distinguishes this from other effects films, is that, although everything is computer generated, it still looks cartoonish and funny, rather than excessively smooth, detailed, or realistic, which would probably be less appropriate given the comic nature of the plot.

Return to [Movie Index](#).

The Truman Show

As featured in the [set extensions](#) section of the technical overview, the digital sets used in this film created a subtle, but important effect, adding a sense of size and realism to the town of Seahaven.

Return to [Movie Index](#).

What Dreams May Come

Though I found the film to be excessively sentimental and somewhat shallow, I must admit the scenery was spectacular. Robin Williams plays a doctor who paints as a hobby, and, after a fatal car accident, finds himself in heaven. The heaven he goes to is shaped by his own mind and experience, and thus appears in some scenes as a kind of interactive oil painting. The painted world generated digitally for the film is quite spectacular, as are later sequences of upside-down cathedrals and the gates of hell.

Return to [Movie Index](#).

Conclusions

Though there is certainly the potential for both positive and negative uses of this technology, it is my belief that the negative uses are largely a passing fad. Though it is possible, through the use of dazzling visual effects, to hold people's attention without engaging their minds, viewers will eventually tire of this, and films whose sole appeal rests on their use of digital technology will no longer be successful. Previous fads, such as 3-D movies, have met a similar fate.

On the positive side, digital technology presents filmmakers with unique opportunities to engage the human imagination. It is now possible, within the constraints of a reasonable budget, to take the viewer to times and places whose sets could never be constructed using traditional techniques. We can now portray the immensity of space, the beauty of ancient lands, or the cruelty of war with unprecedented realism and detail.

While the digital computer, like any tool, has a potential for good or evil, I maintain optimism that, as time goes on and the art matures, filmmakers will find increasingly brilliant, inspiring, and moving ways in which to make use of this technology. Certainly the highly anticipated new *Star Wars* trilogy will represent some kind of breakthrough, as will Stanley Kubrick's next science fiction film, *AI*.

Another important point is that, as a viewer, you can pick and choose which movies you watch, so that if any of your favorite films are aided by computers, the technology has been of service to you, regardless of the number of bad movies it creates as a side effect. The only real downside, I suppose, would be if computer technology had a kind of insidious effect on the film market, promoting flashy effects pictures to the exclusion of more creative, artistic endeavors, but I see no evidence of this. Moreover, as George Lucas has noted, digital technology will ultimately make it *easier* for new and independent filmmakers to succeed, as the cost of making feature films is steadily reduced.

In short, though it is impossible to tell what the future may bring, it is clear to me, having watched a great number of these films, that there is an amazing potential in this technology. One can only hope that this potential will continue to be fulfilled.

Quantitative Measures: Introduction

It is the point of view of the theorist that human phenomena, however complex, can be modeled and understood with the same clarity and rigor as those of the "natural" world. Though no formal device can hope to have the last word on a subject so daunting as human behavior, there exists nevertheless a rich set of tools, developed and employed in the fields of business, economics, and experimental psychology, which have provided countless insights into the workings of a complex social world.

My goal in this project was to investigate and, if possible, elucidate the effect of a tool, the digital computer, on the art of motion pictures. Though subjective judgment was obviously called for, having seen the vast amounts of objective information available on the topic, I perceived the problem as potentially a qualitative one as well. This being established, I knew from the outset that statistical analysis would be indispensable to my work. For it is only through statistical analysis that, out of the formidable data sets available to researchers, the first meaningful patterns and associations can become clear.

Motivations

In first deciding upon this project, I took it upon myself to ensure the availability of sufficient resources. I browsed the worldwide web, searching for pages related to movies or to the use of computers in movies. Of the hundreds of pages that turned up, there were two sites that stood out as exceptionally relevant and informative: The Internet Movie Database (IMDB) and VFX-HQ (Visual Effects Headquarters).

The Internet Movie Database¹, or IMDB, is an online database of over 125,000 movies. Each listing contains the movie's title, year of release, and, when available, a brief plot summary, MPAA ratings and the reasons they were given, tag lines, trivia surrounding the film's production, "goofs" or technical glitches in the movie, memorable quotes, business information including budget, domestic and foreign earnings, and opening-weekend domestic revenue, full credit listings, a 1-10 scale rating (based on an online opinion poll), genre keywords, production companies, technical info, and more. It is a huge wealth of information which, as far as I know, is unsurpassed in its scope by any movie database in the world, in any medium, electronic or otherwise.

Visual Effects Headquarters² is one of the most extensive sites on visual effects. It features technical overviews and analyses of almost every major effects movie since 1994, as well as in-depth articles on the processes involved in creating cutting-edge effects for films. For each movie, the techniques involved in its production are listed, as well as the author's opinions on how effective the visuals were in the film. Certain key phrases, such as "digital composites", "CG characters", and "digital matte" would let me know whether computers had been involved in the production of each movie.

I recognized that between these two sources it would be possible (through VFX-HQ) to compile a list of all movies (at least since 1994) which had used computers in the production of their visual effects, and that, through the IMDB, I could obtain a wealth of information on each movie. It would then be possible, for example, to calculate the average earnings of movies that used computers vs. those using traditional effects, or vs. those that used no effects whatsoever. Furthermore, I was confident that, with a little more research, I would be able to extend my list to include movies released prior to 1994. I knew of one book, *Industrial Light and Magic: Into the Digital Realm*, that contained listings of such movies, and there were sure to be more.

Given this data, the possibilities for analysis would be numerous. In addition to the average I mentioned above, I could calculate averages for budget, opening weekend revenue, foreign earnings, and more. I could calculate separate averages for different genres, and compare among them to see which genres were being aided the most by the use of computers. I could obtain critical ratings, through Roger Ebert's site³ and Leonard Maltin's annual movie & video guide, and determine whether computer-aided films were more or less popular with the critics. I felt certain that, with all the data I would have available, some meaningful conclusions could be drawn.

¹ <http://www.imdb.com>

² <http://www.vfxhq.com>

³ <http://www.suntimes.com/ebert>

Procedures

I. Gathering Data - The Preliminary List

The first step toward drawing any meaningful conclusion about this subject was to compile a list of movies that used computers in the production of their visual effects. By copying the titles in the VFX-HQ annual indices⁴, I was able to get a list of about 150 movies. To this I added all titles in the "filmography" section of the ILM book⁵, bringing the total to around 200. I did not bother, at this point, to determine which of the movies used computers and which used traditional techniques; I would get to that later.

II. Gathering Data - Tedium

For a period of approximately six hours, I found myself struggling to maintain consciousness, listening to *Abbey Road*⁶, and typing name after name into the IMDB search engine. I would type in a title, get a page back, click on the "Business Information" link, and copy down the figures for budget, opening weekend revenue (domestic), and domestic and non-domestic gross. About three quarters of the way through, I realized it would be potentially useful to copy down the popular ratings and genre keywords, too, so I had to go back and conduct most of the searches a second time. Finally, I went to Roger Ebert's site, performed the same 200 searches, and copied down the ratings, on a scale of zero stars to four, into my ever-growing MSWorks⁷ spreadsheet.

III. A Brief Attempt at Analysis

At this point, I decided to try calculating some average figures. I tried to do it the easy way -- through MSWorks' column averaging feature, but for many of the movies, certain information, such as the budget or the opening weekend gross, had been unavailable. In these cases, I had written "NA", for not applicable, in the corresponding field. The spreadsheet program, of course, did not know this, and treated the "NA"s as zeroes. This forced me to do many of the calculations manually, which, again, was quite tedious.

IV. Gathering Data - Automation

While looking through the "Help" section of the Internet Movie Database (I don't remember why), I

stumbled across a piece of information that would greatly expand my project. I found that, in addition to the web-based, searchable archives of the IMDB, there were plain text files available for download that contained the same information. While this distinction may seem trivial to a non-specialist, to a computer scientist it represents a fundamental difference in the way the data can be accessed. Whereas earlier I had manually typed in each title and copied down each field, I could now write a computer program to do that work for me, automatically. The analysis could also be automated, with "NA" fields treated however I wanted them to be, and any number of complex averages, statistics, and correlations calculated with relative ease.

But why, you might ask, would I take the time to write such a program when I had already gone to the trouble of creating the database manually? The answer lies in the extensibility of the automated approach. Whereas doubling, say, the number of titles in a manually generated database would involve twice the work, once a program is written it will run equally well, no matter how many titles there are. The sheer quantity of information to process would no longer be a barrier. This opened up many possibilities which before had been impractical. For example, it would now be possible to include *all* titles in my database (not just the ones using computers), and calculate separate statistics for the movies that used computers and the movies that didn't. By comparing the two sets of statistics, I might discover something useful. Furthermore, I would no longer have to struggle with the limitations of my spreadsheet software, since any calculation imaginable could be programmed in. In the end, I was able to compile a database of over 3500 titles, and to perform complex statistical analyses which otherwise would not have been possible.

This is not, however, to imply that writing such a program is easy. To parse and interpret the IMDB text files required a substantial programming effort, as did the statistical calculations. It was, in fact, a project unto itself, comprising over 2000 lines of C++⁸ code, and as such deserves a separate section (see Appendix A: [The Program](#)).

V. Gathering Data - The Final List

When I first compiled it, I knew that my preliminary list of movies using computers was not complete. All though my database now in fact contained all American movies made after 1977⁹, it was still necessary to know which ones used computers and which ones didn't. My list contained only ILM's movies prior to 1994, and the VFX-HQ annual listings, while extensive, were not necessarily authoritative. I had to find other sources. Looking through the VFX-HQ pages, I discovered a listing of prominent special-effects companies with links to their home pages. At the same time, I discovered how, via the IMDB, to enter the name of a production company and obtain a listing of all movies with which the company had been involved. My research then consisted of two stages. First, I copied the titles for each company into a "candidate" movie list of movies that, while certainly making use of special effects, did not necessarily use computers to create them. I then refined this list by visiting the home pages of each company. If the company claimed to be an "all digital studio", I could check off each movie under its name as definitely using computers. Finally, I went through the VFX-HQ listings for each remaining candidate movie one at a time, reading the descriptions, and checking off the movies that used computers. I ended up with a list of almost 300 movies. Though there are probably a few omissions, the list I have compiled is certainly the most authoritative one that I know of.

VI. The Art of Statistical Correlation

With all this data, who needs averages? Recognizing the arithmetic mean as a crude and limited approach, and excited by the powers of my new program, I decided to pursue more advanced statistical techniques. From my readings in psychology, I knew that the Pearson correlation¹⁰ allows you to

calculate the degree of relationship between two variables. Eager to know more, I went to the WPI library, checked out two elementary statistics books, and began reading. I found out how to calculate Pearson correlations, coded the calculation into my program, and, leaving no stone unturned, computed correlations between every combination of fields (i.e. columns) I had access to.

VII. Advanced Statistics

Though to understand why, you will need to see a later section ([Statistics: A Mathematical Primer](#)), the Pearson correlation is rather primitive as far as correlations go. I felt I needed to use the best statistical tools available, so I researched partial and multiple correlations (again, see the mathematical primer). The calculations turned out to be somewhat more difficult than I expected. Though the equation was straightforward in the three variable (or three column) case, most books considered the case of more than three variables to be "beyond the scope of this book" or an "advanced topic". It was only after a considerable amount of research, skimming through dozens of statistics books, that I was able to find the necessary equations.

VIII. Drawing Conclusions

In analyzing this data, I went through every possible pair of correlations one at a time, and tried to infer from it as much as I could. In the [analysis](#) section, you can see the results of my work for each correlation. The [Conclusions](#) section presents a summary of the results.

⁵ *Industrial Light and Magic: Into the Digital Realm*

⁶ The last Beatles album

⁷ Microsoft Works, a popular word processor/database/spreadsheet package that came with my computer.

⁸ A popular, and in my opinion the best, computer programming language.

⁹ The year *Star Wars* was released, the first feature film to use computers in its production.

¹⁰ See [Statistics: A Mathematical Primer](#)

The Movie Tables

The following tables contain entries for every American movie released since 1977. For each movie, the title, year of release, Roger Ebert and Leonard Maltin ratings, IMDB rating, budget, opening weekend revenue, domestic gross, non-domestic gross, and genre categories are listed. A detailed explanation of each field can be found below.

Title - The title of the movie.

Year - The year in which the movie was released.

Ebert - The rating Roger Ebert gave the movie, on a scale of zero stars to four, four being the highest.

Maltin - The rating Leonard Maltin gave the movie, on a scale of one to four stars, four being the highest.

IMDB - Internet Movie Database rating, on a scale of 1 to 10, 10 being the highest. Anyone with access to the Worldwide Web can log onto the Internet Movie Database and vote for any movie they choose. The figures in this column represent the average votes submitted by users of the database for each movie.

BGT - Budget, in millions of dollars. Refers to the amount of money set aside by a production company for the film, not necessarily the actual amount the company ended up spending.

OW - Opening weekend domestic gross, in millions.

DG - Domestic gross, in millions.

FG - Foreign gross, in millions.

Genre - This column lists the genre categories into which the movie falls, as listed in the IMDB.

Possible categories are: Action, Adventure, Adult, Animation, Children's, Comedy, Crime, Drama, Documentary, Fantasy, Film-Noir, Horror, Musical, Mystery, Romance, Sci-Fi, Short, Thriller, War, and Western.

*An asterisk next to a title indicates that computers were used in the production of the movie. For all fields, "NA" indicates the information was not available.

Since the table is very large, I have divided it into thirteen sections. The first contains titles beginning with A or B (or digits), the second with C or D, and so on. Additionally, I have duplicated the records for all movies using computers in their production in a separate table for ease of use. In the computers-only table (see below), the asterisk next to each title is omitted, since it would be redundant.

The computers-only table can be found [here](#).

The full tables can be viewed by following the links for each section:

[AB](#) - [CD](#) - [EF](#) - [GH](#) - [IJ](#) - [KL](#) - [MN](#) - [OP](#) - [QR](#) - [ST](#) - [UV](#) - [WX](#) - [YZ](#)

Statistics

I. A Mathematical Primer

For a detailed treatment of statistical analysis, the reader is referred to the books by Bryant¹¹, O'Toole¹², and Peatman¹³. This section is intended only as an informal and intuitive introduction to the subject.

A. The Pearson Correlation

Karl Pearson
1857-1936

The Pearson correlation, developed around the turn of the century by British mathematician and scientist Karl Pearson, describes the degree of relationship between two variables on a scale of -1 to 1. A Pearson correlation of -1, for example, indicates that two variables are oppositely related; when one goes up, the other will go down. A Pearson correlation of 1 indicates a perfect positive correlation. As an example, suppose you were taking a road trip to Chicago, and leaving from your house in New York City, driving, strangely enough, in a perfectly straight line. If you were to measure, as you went along, the current distance between your car and Chicago, and your car and New York City, and record them in a table, you would find that the Pearson correlation between the two was -1. On the other hand, if you recorded, say, the distance from New York City in one column, and the number of miles on your odometer in another, you would find a Pearson correlation of 1. Correlations between -1 and 1 indicate less-than-perfect correlations, while 0 indicates no

relationship at all.

The Pearson correlation is commonly denoted by the lower-case letter r , and can be calculated by the following formula:

$$r = \frac{n' \sum (XY) - (\sum X)(\sum Y)}{\sqrt{[n_x \sum X^2 - (\sum X)^2][n_y \sum Y^2 - (\sum Y)^2]}}$$

where n' is the number of defined X - Y pairs, X is the values of the first variable to correlate, Y is the values of the second variable to correlate, n_x is the number of defined X values, and n_y is the number of defined y values.

B. Multiple Correlation

The multiple correlation, commonly denoted by the capital letter R , expresses the degree of relationship between a single variable and one or more other variables, again on a scale of -1 to 1. As an example, you might expect there to be a high positive correlation between a child's height and his mother's and father's heights, whereas you would expect there to be a significant negative correlation between a child's height, his use of elevator shoes, and his eligibility as a circus midget.

For three variables, the degree of relationship between a variable x and two other variables, y and z , can be calculated by the formula:

$$R_{x,yz} = \sqrt{\frac{r_{xy}^2 + r_{xz}^2 - 2r_{xy}r_{xz}r_{yz}}{1 - r_{yz}^2}}$$

where r_{xy} , r_{xz} , and r_{yz} are Pearson correlations.

For more than three variables, the formula is significantly more complicated and will not be given here. The reader is referred to Bryant's book for a more detailed treatment.

C. Partial Correlation

It is possible, when measuring the degree of relationship between two variables via the Pearson correlation, to obtain misleading results. As an example, suppose you had a group of school children, and you were trying to determine if there was a relationship between their height and, say, their ability to solve math problems. If the children were chosen from a variety of age groups, there may indeed be a significant positive correlation between height and mathematical ability, but the reason is not, as the correlation might lead you to believe, that taller children are inherently better at math, but rather that taller children tend to be older, and older children tend to be better at math. What is needed in this context is a way to "take age out of the equation", or to eliminate the influence of age upon the other two variables. For this we use the partial correlation.

The partial correlation gives you the degree of relationship between two variables, with one or more other variables "held constant", again on a scale of -1 to 1.

For three variables, the relationship between x and y with z held constant is given by the following formula:

$$r_{xy.z} = \frac{r_{xy} - r_{xz}r_{yz}}{\sqrt{1 - r_{xz}^2} \sqrt{1 - r_{yz}^2}}$$

again, where r_{xy} , r_{xz} , and r_{yz} are Pearson correlations.

D. Predictive Efficiency

The Pearson correlation, r , can be converted to a percentage which is more intuitively meaningful than the -1 to 1 scale value. For example, a Pearson correlation of .67 converts to 26% predictive efficiency. This means that, if you have a Pearson correlation of .67 between variables x and y , given an x value you will be able to predict the corresponding y value with 26% accuracy (or vice versa), i.e. 26% more efficiently than if you simply took a random guess at the value of y .

The formula for calculating predictive efficiency, commonly denoted by the capital letter E , is as follows:

$$E = \left(1 - \sqrt{1 - r^2}\right) \times 100\%$$

where r is of course the Pearson correlation.

II. The Statistics Tables

The following table provides statistical correlations between the fields in the movie table presented earlier. Each row in the table contains correlations for a specific combination of variables.

For example, the following row:

Field 1	Field 2	Pearson's r	r.Year	r.Budget	r.Computer Use
Domestic Gross	Non-USA Gross	0.80 (40.8%) [265]	0.82 (43%)	0.74 (33.5%)	0.79 (39.6%)

tells us that there is a high degree of correlation (40.8% predictive efficiency) between domestic and non-domestic gross, in other words, that foreigners tend to like the same movies as Americans.

A detailed explanation of each field in the statistics table is given below:

Field 1 - The first, or "X" variable in the calculations. Note that the order of the two fields is not logically significant, i.e. the correlations between Domestic Gross and Non-Domestic Gross are exactly the same as those between Non-Domestic Gross and Domestic Gross.

Field 2 - The second, or "Y" variable in the calculations.

Pearson's r - The Pearson correlation between the two variables. (See "The Pearson Correlation" above). The predictive efficiency associated with this r value is the figure in parenthesis, while the number in brackets ([]) indicates the number of samples the correlation was based on.

r.Year - The partial correlation between the two variables with only the year field held constant.

r.Budget - The partial correlation between the two variables with only the budget field held constant.

r.Computer Use - (see the "Boolean variables" section below for an explanation of how computer use can be treated as a numeric field)

Boolean variables

It may occur to the reader that certain "variables" in this analysis, such as genre, use or non-use of computers, and critical star ratings, are not readily expressed as numbers. How, then, were the statistics computed? The answer lies in the use of what are known in computer science as boolean variables, variables that always take on the value of 0 or 1. For example, the "Computer Use" field can be treated

as zero if the movie does not use computers and 1 if it does. Similarly, if a movie included Action as one of its genres, the Action field takes on a value of 1, and a value of zero otherwise.

Finally, for the Roger Ebert and Leonard Maltin ratings, the ratings were expressed numerically as a certain number of "half stars", f.e. four stars is eight half stars, while 2½ stars is 5 half stars.

Statistics Tables Index

In calculating these statistics, I performed separate calculations for a number of subsets of the movie database as a whole. First, I calculated statistics for all the movies, then for only those movies which used computers in their production. Next, I calculated statistics for movies in each specific genre (i.e. one set for all action movies, one for all comedies, etc.). Finally, for ease of analysis, I created another statistics table containing the same information, but arranged with the correlations on the horizontal axis and the subset name on the vertical axis.

The statistics table for all movies can be found [here](#).

For the computers-only table click [here](#).

Statistics tables specific to each genre can be found by clicking on the appropriate genre name:

[Action](#) - [Adventure](#) - [Adult](#) - [Animation](#) - [Children's](#) - [Comedy](#) - [Crime](#) - [Drama](#) - [Documentary](#) - [Fantasy](#)
- [Film-Noir](#) - [Horror](#) - [Musical](#) - [Mystery](#) - [Romance](#) - [Sci-Fi](#) - [Short](#) - [Thriller](#) - [War](#) - [Western](#)

Finally, the statistics are presented in an alternate format in the [correlations by genre](#) table.

¹¹ *Statistical Analysis*, by Edward C. Bryant (see bibliography)

¹² *Elementary Practical Statistics*, by A.L. O'Toole (see bibliography)

¹³ *Introduction to Applied Statistics*, by John G. Peatman (see bibliography)

Analysis

In analyzing these statistics, I went through each set of correlations, one at a time, and tried to infer as much as possible. Though many of these correlations do not pertain directly to the effect of computers on movies, I have, for completeness sake, analyzed and commented upon them all. In the paragraphs below, the conclusions I drew for each specific set of correlations are presented. For ease of comparison, I have presented all correlations in terms of their predictive efficiency, i.e. "a correlation of 1.5%", means a correlation with 1.5% predictive efficiency. Additionally, I chose to ignore certain correlations that were unusually high or low but based on a very small (less than 10) number of samples. Finally, all correlations listed are Pearson correlations unless otherwise noted.

Year to Budget - Surprisingly, the correlation for movies in general is higher than that for computer movies, suggesting that computer movies are not rising in production cost as steadily as others. This could be attributed to computers cutting costs out of greater efficiency, but most likely it is due to irregularities in the availability of budget data (see [below](#)). Science fiction movies are going up the most over time, with correlation over twice that of movies as a whole. Documentary films appear to be dropping the most sharply, but this is based on only 6 samples and cannot be taken seriously. Other high risers include animation, adventure, fantasy, horror, and war. Shorts, westerns, films noir, and

documentaries are all getting cheaper, though the number of samples for such genres is small.

Year to Opening Weekend - There appears to be a negative correlation between year and opening weekend revenue, suggesting that movies are making less money their first weekends as time goes on. This runs contrary to experience, however, and is likely due to irregularities in the distribution of business information in the database (see [below](#)). Certain genres, such as horror and mystery, display positive correlations in this area which are significantly higher than those in other genres, though again the results are suspect because of the distribution problem.

Year to Domestic Gross - Again, these statistics suggest the quite unlikely conclusion that movies are making less money as time goes on. For an explanation of this, see [below](#).

Year to Non-USA Gross - Like the previous correlation, this one is misleading. see [below](#).

Year to IMDB rating - This statistic is very revealing, because it shows a small positive correlation (0.9%) between movie ratings and the year the movie was released, and a small negative correlation (1.1%) between the ratings of computer movies and their year of release. This suggests that, as time goes on, movies in general are getting better but those that use computers in their production are getting slightly worse. I believe the latter condition is due to the fact that, when computers first began to be used in movies, they were only used in the most innovative and original productions, such as *Star Wars*. As time went on, use of computers became more and more common, until now, when many computer-aided films are quite formulaic and unoriginal. Additionally, these statistics seem to indicate that, at least in the minds of the IMDB voters, musicals have gotten significantly better (9.7%), romances, comedies, and dramas slightly better (1.6%, 0.9%, and 0.7%, respectively), fantasies slightly worse (1.8%), and most other genres have been stable.

Year to Ebert rating - Roger Ebert seems to have remained optimistic in his old age. These statistics indicate a near-zero correlation between Ebert ratings and year. The correlation between ratings of computer movies and year, however, is slightly negative (1.5%), and reinforces the ideas I put forth in the preceding paragraph. In terms of genres, Ebert thinks musicals have gotten a lot better (1.8% positive correlation), while action, crime, science fiction, and film noir have all gone slightly downhill (0.5%, 2.1%, 1.7%, and 2.5%, respectively). Other genres, such as comedy and children's, have been stable, with near-zero correlations. The western seems to have gone off the deep end, with a sickening 16.2% negative correlation.

Year to Maltin rating - Leonard Maltin's rating of computer movies indicates they have gotten steadily worse, with a negative correlation of 2.2%. This can not be compared, unfortunately, with his ratings for movies in general, because of a limitation described [below](#). For genres, action, adventure, crime, science fiction, and romance have all gotten significantly worse (10%, 11.9%, 10.1%, 11.1%, and 8.6% negative correlations), while drama has been stable, and comedy and war have shown slight improvements (0.9% and 1.7%, respectively).

Year to Computer use - As one would expect, use of computers in film production has increased over the years, with a 1.7% positive correlation between computer use and year of release. Science fiction movies seem to have taken advantage of computers the most often, with a 7.5% correlation, with war movies a close second (6.7%), followed by action (5.4%), children's (4.6%), and fantasy (4.4%). All genres exhibited a positive correlation in this area, with romance tending to increase its computer use the least, at 1%.

Budget to Opening Weekend - Not surprisingly, there was a high positive correlation between a movie's budget and its opening weekend revenue (20%). Big-budget movies generate a lot of initial hype, and are often able to start with a bang at the box office even if they fizzle out down the road. What may be surprising is that computer movies, which we think of as being the kings of hype, have a lower positive correlation (12.6%) than movies as a whole. For genres, drama, war, and romance had the highest positive correlations (discounting film-noir, which had only 3 samples and thus is not significant), at 27.5%, 22.9%, and 21.7%. Action movies, which we usually think of as generating a lot of hype, had a surprisingly low positive correlation of 9.9%.

Budget to Domestic Gross - Similar to the previous set of statistics, the figures for these two fields indicate that computer movies have a lower correlation than movies as a whole between the amount of money spent on their production and the amount of money they rake in at the box office (correlations of 7.5% vs. 13.5%, both positive). Dramas, which we think of as relying more on good writing and acting, exhibited the highest correlation of any genre, at 23.6%, which I found quite surprising. Action movies again exhibited one of the lower correlations, at 3.4%, while romance, thriller, comedy, horror, and mystery, were fairly high (17.5%, 14.1%, 11.6%, 11.5%, and 10.3%).

Budget to Non-USA Gross - The correlations between budget and non-domestic gross are weaker than those for domestic gross for movies as a whole (11.7% vs. 13.5%), but higher for computer movies (10.7% vs. 7.5%). The fact that the non-domestic correlations for computer movies and movies in general are so close together (10.7% and 11.7%) seems to indicate that foreigners are less affected by computer use than Americans. In foreign markets, dramas and romances again exhibited high correlations (27% and 26.4%, respectively), while action was again rather low, at 4.4%.

Budget to IMDB rating - Both computer movies and movies in general exhibit a slight negative correlation between budget and IMDB rating. The two correlations are very close, both around 0.1%. Thus, while big-budget movies tend to earn more at the box office (see correlation between budget and domestic gross below), when people are asked to rate them on a scale of 1 to 10, they will receive lower marks. Funny, isn't it? This relationship was particularly strong for fantasy films (4.8%), fairly weak for most other genres, and, as the only exception to the rule, children's movies exhibited a *positive* correlation of 2.3% in this area.

Budget to Ebert rating - Like the IMDB voters, Roger Ebert tends to give lower marks to movies with higher budgets. In this case, however, there is a slight difference between the correlations, both negative, of movies as a whole (0.1%), and computer movies (0.3%). Among negative correlations, those for science fiction (8%), fantasy (5.8%), and action (1.4%) were particularly strong. On the positive side, higher-budget animated features and children's movies received higher marks, with positive correlations of 13.4% and (an impressive) 34.9%.

Budget to Maltin rating - Unlike either Roger Ebert or the IMDB voters, Leonard Maltin seems unaffected by movie budgets. His correlations are near-zero overall, as for most genres, with the exception of strong negative correlations for science fiction (4%) and fantasy (1.8%), and positive correlations for crime(0.8%) and drama(1.1%).

Budget to Computer use - There was a high positive correlation between budget and computer use (16.8%), reinforcing either the notion that computer movies tend to cost more, or that computers tend to be used in the production of higher budget movies. I would lean toward the latter, since clearly

computers are an economically efficient way of getting things done. For genres, positive correlations for crime (17.7%), romance (17.4%), thriller (15.7%), drama (15.6%), and science fiction (13.5%) were all fairly high, while children's (6.2%) and animation (0.1%) were rather low, and musical was actually slightly negative (0.4%).

Opening Weekend to Domestic Gross - The correlation between opening weekend and domestic gross is higher for movies as a whole (35.9%) than for computer movies (24.6%). This suggests that computer movies are less "predictable", that the excitement generated by their advertising (which determines opening weekend revenue) is not as closely related to their overall earnings (determined by word of mouth, etc.) as it is for movies as a whole. Among genres, thrillers (57.2%), musicals (48.7%), and children's films (48.4%) had the highest correlations, while those of science fiction films (23.3%) and films noir (18.5%) were among the lowest, with documentary films (3.5%) at the very bottom.

Opening Weekend to Non-USA Gross - The correlations between opening weekend and non-domestic gross were quite a bit lower than those for domestic gross, at 16.5% for movies in general and 12.6% for computer movies. Again, the figure for computer movies is lower. Children's films (51.1%) and musicals (47.2%) had the highest correlations here, with romance (11.7%) and comedy (22.1%) among the lowest.

Opening Weekend to IMDB rating - This statistic indicated a slight negative correlation between opening weekend and IMDB rating for movies in general (0.2%), and a slight positive one for computer movies (0.6%). The correlations for these fields are never greater than 5% for any genre, so there appears to be little relation between these variables.

Opening Weekend to Ebert rating - Again, a slight negative correlation for movies in general (almost 0%) and a slight positive one for computer movies (0.3%). The correlations for these fields are very low. Opening weekend revenue seems to bear little relationship to popular or critical ratings.

Opening Weekend to Maltin rating - The correlations for Leonard Maltin's ratings with opening weekend gross are higher than those for Roger Ebert or the IMDB voters, but are still relatively low, at 1.5% for computer movies. (The figure for movies as a whole is unavailable, see [below](#)).

Opening Weekend to Computer use - Movies in general exhibit a strong correlation between their use of computers and their opening weekend revenue (9.6%). This is not surprising, since special effects are easy to showcase in previews and can attract large initial audiences. Correlations for drama (10.4%), fantasy (13.4%), and romance (12.9%) were among the highest, while those for thriller (4.8%), horror (2%), and children's (0.1%, negative correlation) were rather low.

Domestic Gross to Non-USA Gross - This statistic, though not really related to the project, was particularly interesting to me because it shows what types of movies Americans and non-Americans tend to have the same reaction to, and on what types their opinions tend to differ. The correlation for movies as a whole was 40.8%, quite close to the correlation for computer movies, 43.7%. Dramas (52.5%) and romance (59.9%) had some of the highest correlations, while fantasy (32.3%), action (33.3%), adventure (33.5%), and comedy (39.8%) were significantly lower.

Domestic Gross to IMDB rating - The correlation between domestic gross and IMDB rating is higher for computer movies (4.7%) than for movies as a whole (0.1%), suggesting that, for movies using computers in their production, people's opinion of the movie after they have seen it (on a scale of 1 to

10) is more closely linked to their propensity to buy tickets to the movie. This indicates to me, that with computer movies, people are more likely to feel, upon leaving the theater, than they "got what they paid for". Among genres, westerns (7.2%) and fantasy films (5%) had the highest correlations in this area, while romances (0.6%), dramas (almost 0%), and comedies (0.2%) had among the lowest.

Domestic Gross to Ebert rating - The correlation between domestic gross and Roger Ebert's ratings is, again, higher for computer movies (3.7%) than for movies in general (0.9%). This tells me that Roger Ebert's feelings on computer movies are closer to the public's than for other movies, suggesting, perhaps, that the effects achieved by computers affect the viewer at an emotional or subconscious level rather than an intellectual one, since it is on intellectual matters that critics and people as a whole tend to disagree. For genres, westerns (32.4%) and animated features (14.1%) had by far the highest correlations, while those of action (2.9%), adventure (2.8%), comedy (1.8%), romance (2.9%), drama (1.8%), and science fiction (1.7%) were all significantly lower.

Domestic Gross to Maltin rating - The correlations for Leonard Maltin are, as seems to be the pattern, higher than those for Roger Ebert, at 6.6% for computer movies (the figure for movies as a whole is unavailable, see [below](#)). Maltin's opinions on action (14.3%), adventure (15.7%), romance (18%), and fantasy (22.6%) movies seem to be most in line with the movies' popularity, while the correlations for drama (6.3%) and comedy (1.2%) are lower, and the correlation for horror movies is actually slightly negative (0.1%).

Domestic Gross to Computer use - The correlation between domestic gross and use of computers is strong and positive (4.9%), suggesting, as we all knew before, that movies that use computers in their production tend to have higher earnings at the box office. Among genres, the correlation was highest for war movies (8.2%), though this may largely be due to Steven Spielberg alone (*Empire of the Sun*, *Schindler's List*, *Saving Private Ryan*). Science fiction (8.1%) was a close second, followed by adventure (7.1%), action (6.8%), and romance (6.6%). It is these genres that seem to benefit the most, economically, from computer technology. Among the lowest correlations were those for children's (2%) and horror films (1.2%). Correlations were positive for all genres, indicating that any type of movie tends to benefit from computer technology. These conclusions are based on the Pearson correlations between the two fields.

However, if we recognize that computers may tend to be used in higher-budget films, and it is this higher-budget, not the use of computers, that may often account for the increased revenue, it becomes necessary to look, not at the Pearson correlation, but at the partial correlation r_{budget} . The r_{budget} correlation for all movies is in fact almost 0%, compared to the misleading 4.9% Pearson correlation. When we look at genres for r_{budget} , we see that adventure again makes a strong showing, with 7.1%, but that war has dropped to 4.2%, science fiction to 5.7%, action to 4%, and romance to 0.1%. The top genres are now adventure (7.1%), fantasy (6.8%), science fiction (5.7%), and animation (5.1%). The lowest genre correlations are now negative, for drama (0.2%) and horror (0.1%). Use of computers actually tends to diminish box office earnings for these genres, though the correlations are very slight. The next lowest correlations are positive, those for thriller and comedy (both almost 0%), romance (0.1%), and children's (0.4%). This represents a much more intuitive grouping, I think, than the one given by the Pearson correlation.

Non-USA Gross to IMDB rating - The correlations between these two fields are higher for computer movies (3.7%) than for movies in general (1.4%), reinforcing the argument made in the "Domestic Gross to IMDB rating" section. In terms of genres, the correlations are strongest for fantasy (15.5%), horror (9.9%), and children's movies (8.7%). Genres with the lowest correlations include comedy (0.6%)

and romance (1.3%).

Non-USA Gross to Ebert rating - The correlations between these two fields are again higher for computer movies (3.5%) than for movies as a whole (2%), reinforcing the conclusions of the "Domestic Gross to Ebert rating" section. Among genres, the correlations were highest for fantasy (6.9%) and horror (5.5%), and lowest for science fiction (0.6%) and crime (0.5%).

Non-USA Gross to Maltin rating - Again, as in the "Domestic Gross to Maltin rating" section, the correlations for Leonard Maltin are higher than those for Roger Ebert (5.6% for computer movies). The figure for movies in general is not available, for reasons given [below](#). Among genres, the correlations for thriller (12%) and romance (10.6%) were the highest, while those for crime (6.5%) and drama (4.7%) were the lowest.

Non-USA Gross to Computer use - Following the argument made in the "Domestic Gross to Computer Use" section, I will look at *r.budget*, rather than the Pearson correlation, for analysis of these correlations. The *r.budget* correlation for all movies is, surprisingly, slightly negative, at 0.2%. The use of computers, independent of budget, does not seem to help movies in the foreign markets. Not for movies as a whole. For specific genres, however, there are positive correlations, for example war (23.1%), action (0.8%), and adventure (0.2%). The unusually high figure for the war genre is most likely a result of the Spielberg bias described in the "Domestic Gross to Computer Use" section. Among genres that were worse off when computers were used (negative correlations), horror (13.3%) and children's (2.4%) fared especially poorly.

IMDB rating to Ebert rating - This particular set of correlations has absolutely nothing to do with the impact of computers on movies, but it is interesting anyway because it indicates how closely Roger Ebert's ratings are related to the opinions of the IMDB voters, and in which genres the two are more and less closely linked. The correlation for movies in general is 9.4%, while for computer movies it is 16.1%. Ebert and IMDB ratings are more closely correlated for computer movies, suggesting the idea that computer movies are in this respect *more* "predictable", and also the idea that the computer effects appeal to people on an emotional or subconscious level, rather than an intellectual one. Among genres, animation (23.1%) and documentary films (17.4%) had the highest correlations, while drama (5.3%) and horror (4.2%) were among the lowest.

IMDB rating to Maltin rating - The correlation between these two fields for computer movies is 14.7%. Again, the figure for movies in general is not available (see [below](#)). The fact that this correlation is lower than the correspond Roger Ebert correlation suggests that Leonard Maltin is the more mainstream critic of the two. Among genres, the correlations for action (25%), science fiction (20.2%), and thriller (21.5%) were among the highest, while those for comedy (7.8%) and horror (9.4%) were among the lowest.

IMDB rating to Computer use - There appears to be virtually no relationship between IMDB ratings and the use of computers in movies. The correlation is nearly zero. For specific genres, however, there are some positive correlations, such as for science fiction (1.1%) and animation (0.8%), while there were also significant negative correlations, such as for westerns (1.1%), crime movies (0.6%), and thrillers (0.3%).

Ebert rating to Maltin rating - Again, a set of statistics having no direct relationship to this project, but which are interesting nonetheless. The correlation for movies in general is 9.4%, while for computer

movies it is slightly higher, 9.6%. This suggests, again, that computer movies are more predictable. Among genres, the highest correlations were for comedy (18%) and romance (23.3%), while the lowest were for horror films (1.2%), thrillers (3.8%), and action movies (4.4%).

Ebert rating to Computer use - Roger Ebert's ratings seem to be virtually unaffected by the use of computers; the correlation is nearly zero. Again, however, there are significant correlations for specific genres. The highest correlations were for animations (6.5%) and children's movies (5.5%). The lowest positive correlations were for the action (0.1%) and adventure (0.2%) genres. There were also negative correlations, for the crime, mystery (both almost zero) and musical (1.7%) genres.

Maltin rating to Computer use - The correlations between Leonard Maltin's ratings and computer use are unfortunately unavailable, due to the reasons explained in the section [below](#).

The business information distribution problem

Business information such as budget, opening weekend revenue, and domestic and non-domestic gross was obtained from IMDB files which, while tending to contain business information for most recent movies, only contain such information for the most famous, blockbuster films that were produced a longer time ago. This leads a computer program, ignorant of this fact, to conclude that all early movies were blockbusters. This misguided conclusion is due to a bias in the data, and does not represent a flaw in the correlational techniques. It does, however, lead to several misleading correlations, such as the negative correlation between year of release and domestic gross, which, were this bias not known, would suggest to the analyst that movie earnings are declining as time goes on.

Lack of data for Maltin ratings

Unfortunately, the only critic for whose ratings I was able to find an electronic resource was Roger Ebert. I had to enter the Leonard Maltin ratings manually into my own database, looking them up in his annual movie and video guide, and so could only take the time to do so for the set of 300 or so movies that used computers. It is for this reason that statistics involving all movies or "movies as a whole" are not available for the Maltin ratings.

Conclusions

- Use of computers in movie production has been increasing. While this is obvious from simple everyday observation, the statistics show that the increase has been particularly rapid in the science fiction, war, action, children's, and fantasy genres.
- Computerized effects are losing their novelty. The film market has, in the past few years, become saturated with effects pictures, and people are getting tired of it. Witness the negative correlation between IMDB rating and year of release for computer movies vs. the positive correlation for movies as a whole, or the negative correlation between Roger Ebert's ratings and year for computer movies vs. the zero correlation for films in general, or the negative correlation between Leonard Maltin's ratings and year of release, again for movies using computers in their production.

- Somewhat surprisingly, the success of computer movies seems to depend more on their content than that of movies in general. Witness the lower correlation between budget and opening weekend, as well as budget and domestic gross, for computer movies than for movies as a whole. Note, however, that this does not seem to be as true in foreign markets, where only the correlation between opening weekend and non-domestic gross was lower for computer movies.
 - There is more consensus on computer movies, i.e. people's opinions on them tend to be closer than their opinions on movies in general. Witness the higher correlations for computer movies between IMDB rating and domestic gross, between domestic gross and Ebert rating, between non-domestic gross and IMDB rating, between non-domestic gross and Ebert rating, and between IMDB rating and Ebert rating. Presumably, computerized special effects hit the viewer at a subconscious or emotional level, rather than an intellectual one, explaining the higher consensus on movies featuring such effects.
 - Though there is a high correlation between computer use and budget, this is not so much an indication that computer effects are expensive as it is a sign that computers tend to be used in the production of higher budget films.
 - Movies as a whole *do not* earn more by using computers in their production, though certain genres may. Specifically, the adventure, science fiction, fantasy, and animation genres seem to benefit substantially at the box office from the use of computers in their production.
 - The ratings of at least one critic, Roger Ebert, are on the whole unaffected by computer use. For a few specific genres, however, namely animations and children's films, Roger Ebert tends to give higher ratings to movies employing computers in their production.
-

Limitations

I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the sea-shore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me.

- Sir Isaac Newton¹

I now know the meaning of this statement. I could easily spend another seven weeks on this project and still have room to do more. Having collected so much data in an easily accessible electronic form, I regret not having the time to analyze it more thoroughly. Specifically, I would like to have been able to calculate partial correlations with all variables held constant, though the equations were sufficiently complex that I was unable to successfully calculate them. Other ideas I have had include specifying the degree of computer effects used in each movie. Ideally, I would obtain shot counts for each film, though in practice this might not be possible. I would have liked to have at least been able to specify some movies as "effects laden", and to have performed additional correlational analysis based on that classification. Finally, I would like to have had time to more fully research the field of statistical analysis, so that I might better understand the tools available to me.

My second set of regrets has to do with the limitations of the data I collected. I would like to have

added information for award such as the Oscars and Golden Globe, but was unable to find an electronically accessible resource for this information. I would also have liked to have found electronic resources for film critics besides Roger Ebert. Finally, I would have liked, in addition to the genre keywords that are found in the database, to have analyzed the data based on "minor genre keywords", such as "surreal", "time-travel", etc. Though I know of an electronic resource for this information available through the IMDB, I did not have the time to download and parse it.

Final Thoughts

Through qualitative analysis, I have tried to show that digital technology, while potentially destructive to the development of artistic films, has a far greater potential to make movies the splendor and creativity of which our world has not yet seen. My quantitative analysis, while neither directly supporting nor refuting this hypothesis, does much to suggest that, at least in the context of specific genres, computer technology is making movies more profitable, more popular, and, in the opinions of respected critics, significantly better. The quantitative analysis also suggests, as the qualitative one bears out, that the feature film market is currently saturated with effects films. How long this fad will continue to exist, and what the trends will be when it begins to fade, are uncertain, though whatever may come to pass, I hope it is clear from my analyses that computers have made movies great in the past, and they certainly possess the potential, however latent it may become, to do so again.

Matt Streeter
February, 1999

The Program

A large proportion of the hours I devoted to this project were spent in the production of an elaborate program to parse and analyze movie data obtained from the Internet Movie Database. The program is designed to make use of a number of databases -- information for movie titles, genres, business information, Roger Ebert & Leonard Maltin ratings, use or non-use of computers, and country of origin -- and to produce, from the data in these files, the hundreds of pages of charts and tables that are used in this project. Although the program was written from scratch, there is a small section of the code -- that used to perform Gaussian elimination on matrices -- which I downloaded from the public domain. Appropriate credit is given to the author in the module descriptions below. What follows is a generalized, technical description of the program's design, and a set of links to the various files that make up the program's code.

The program consists of three modules. The first, *TABLEGEN*, is the largest, and performs the majority of the work. In this module is the code to load and parse the data from a number of files (in a number of formats), to output this data as a set of HTML tables, to calculate statistical correlations between various fields in the data, and to output the results of these calculations in another set of HTML tables. The second, *STATS*, contains code to calculate Pearson, partial, and multiple correlations. The routines in this module are called by those in *TABLEGEN* to perform computations. Finally, the *GAUSS* module performs Gaussian elimination on a matrix, which is a technique used to solve systems of linear equations. The code in the *GAUSS* module was written by Paul Bourke, and is available through the worldwide web at: <http://www.mhri.edu.au/~pdb/other/gausselim/>.

Here, then, are links to the source code:

TABLEGEN.CPP

```
// Copyright Matt Streeter, 1999

// Matt Streeter
// 2/1/99
// Program to gather statistics from the IMDB (Internet Movie Database)
// text files.

// Possible extensions:
// Fields to add: Awards
// Specify some movies as effects-laden.
// filter out video games, TV shows, etc.
// Calculate effect of computers on genre popularity.
// Filter out movies that haven't come out yet.
// Can use pairs where only one field is defined in Pearson correlation.
// (see p.93 of "Introduction to Applied Statistics")
// Minor genre keywords
// Correlate w/profit ratios.
